Document Revision History

Revision	Date	Author	Description
1.0	2012/11/08	Pan Liu	Initial Version
1.1	2012/11/13	Pan Liu	Update iwpriv command
1.2	2012/12/11	Pan Liu	Add NoForwardingMBCast
1.3	2013/01/04	Pan Liu	Add VHT_BW and VhtBW
1.4	2013/1/14	Pan Liu	Update Apclient WPS command sample
1.5	2013/1/22	Pan Liu	Add FAQ- FixTxMode iwpriv command sample
1.6	2013/1/23	Pan Liu	Add new DAT item VHT_DisallowNonVHT and SingleSKU.dat sample.
1.7	2013/3/6	Pan Liu	Add MAC Repeater section
1.8	2013/3/8	Pan Liu	Add command and profile, DFS debug example
1.9	2013/3/13	Pan Liu	Add Singlesku.dat 5G and 2.4G sample profile and DFS example update
2.0	2013/3/15	Pan Liu	Add IgmpAdd1, WPS command and NEW BSSID Mode MAC address limitation. Update BGProtection
2.1	2013/3/27	Pan Liu	Add EfuseUploadToHost
2.2	2013/3/28	Pan Liu	Add FAQ for TX/RX unbalance issue.
2.3	2013/4/23	Pan Liu	Add iNIC system address configuration for WLAN profile support
2.4	2013/4/23	Pan Liu	Add iwpriv command AP2040Rescan, WLAN profile updates
2.5	2013/5/27	Pan Liu	Add WLAN profile and iwpriv parameters for VHT support.
2.6	2013/6/20	Pan Liu	Update WirelessMode=15, correct NoForwardingMBCast, Add AutoChannelSkipList
2.7	2013/7/4	Pan Liu	Add WLAN profile “EtherTrafficBand”
2.8	2013/7/26	Pan Liu	Add iNIC only profile and iwpriv command
2.9	2013/8/23	Pan Liu	Add iNIC only profile IsolateCard, EnhanceMultiClient, and BGMultiClient.
3.0	2013/8/29	Pan Liu	Add iwpriv command fpga_on, dataphy, databw, databasize, datagi, dataldpc for vht mode data rate setting.
3.1	2013/9/03	Pan Liu	Correct TYPO on DisConnectAllSta
3.2	2013/10/03	Pan Liu	Add VHT MCS table in Q&A
3.3	2013/11/20	Pan Liu	Update Multiple Radiu server usage
3.4	2014/01/08	Pan Liu	Add iNIC only new profile parameters
3.5	2014/01/20	Pan Liu	Update iwpriv commands and APClient command example
3.6	2014/02/11	Pan Liu	Add note for WpaMixPairCipher
3.7	2014/02/27	Pan Liu	Add iwpriv command ApCliAutoConnect and update SiteSurvey
3.8	2014/03/07	Pan Liu	Remove RadioOn from profile SoftAP is not support this option
3.9	2014/03/07	Pan Liu	Add iNIC profile TX&RTS retry counter and EDCCA profile
4.0	2014/04/01	Pan Liu	Update BADeline, datamcs and FixTxMode iwpriv command samples
4.1	2014/05/29	Hughes Kang	Add EDCCA testing
4.2	2014/07/01	Hughes Kang	Add HT_PROTECT, BASetup, BAOriTearDown, BARecTearDown, HT_TxStream, HT_RxStream, HtTxStream, HtRxStream, EntryLifeCheck, WAPI related parameters,

1 Introduction

This document is a software programming guide for Mediatek Wi-Fi SoftAP driver and it teaches you how to configure your own settings. We do provide two kinds of configuration method, profile and iwpriv. Later we show you the profile parameter list, the iwpriv command list, and some OID examples to demonstrate how to fully utilize the WLAN driver.

2.2 Common WLAN Profile Parameters

As you could see in *Section 2.1 Sample Profile*, all the settings obey the following syntax.

[Syntax]

Parameter=Value

The WLAN driver needs to be restarted after changing the profile. Otherwise, settings would not take effect and an interface down/up cycle could help.

ifconfig ra0 down
ifconfig ra0 up

2.2.1 CountryRegion

Description: Country region for WLAN radio 2.4 GHz regulation (G band)
Value:

CountryRegion=5

Region	Channels
0	1-11
1	1-13
2	10-11
3	10-13
4	14
5	1-14 all active scan
6	3-9
7	5-13
31	1-11 active scan, 12-14 passive scan
32	1-11 active scan, 12-14 passive scan
33	1-14 all active scan, 14 b mode only

2.2.2 CountryRegionABand

Description: Country region for WLAN radio 5 GHz regulation (A band)
Value:

CountryRegionABand=7

Region	Channels
0	36, 40, 44, 48, 52, 56, 60, 64, 149, 153, 157, 161, 165
1	36, 40, 44, 48, 52, 56, 60, 64, 100, 104, 108, 112, 116, 120, 124, 128, 132, 136, 140
2	36, 40, 44, 48, 52, 56, 60, 64
3	52, 56, 60, 64, 149, 153, 157, 161
4	149, 153, 157, 161, 165

13	36, 40, 44, 48, 52, 56, 60, 64, 100, 104, 108, 112, 116, 120, 124, 128, 132, 136, 140, 144, 149, 153, 157, 161, 165
14	36, 40, 44, 48, 52, 56, 60, 64, 100, 104, 108, 112, 116, 132, 136, 140, 144, 149, 153, 157, 161, 165

2.2.3 CountryCode

Description: County code for WLAN radio regulation
Value:

CountryCode=

Note:
Default is empy.
2 characters, like TW for Taiwan.
Please refer to the following link for ISO3166 code list for other countries.
http://www.iso.org/iso/prods-services/iso3166ma/02iso-3166-code-lists/country_names_and_code_elements
This parameter can also be configured in EEPROM or eFuse.
Configuration in EEPROM or eFuse has higher priority than that in WLAN Profile.

2.2.4 ChannelGeography

Description: For Channel list builder
Value:

ChannelGeography=1

0: Outdoor
1: Indoor
2: Both

2.2.5 SSID

Description: The target BSSID string name configuration
Value:

SSID=11n-AP

0~z, 1~32 ASCII characters

2.2.6 WirelessMode

Description: Wireless mode configuration
Value:

WirelessMode=9

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.
MEDIATEK CONFIDENTIAL
FOR wang.xiansheng@ ... com.cn USE ONLY

0: legacy 11b/g mixed
1: legacy 11B only
2: legacy 11A only
3: legacy 11a/b/g mixed
4: legacy 11G only
5: 11ABGN mixed
6: 11N only in 2.4G
7: 11GN mixed
8: 11AN mixed
9: 11BGN mixed
10: 11AGN mixed
11: 11N only in 5G
14: 11A/AN/AC mixed 5G band only (Only 11AC chipset support)
15: 11 AN/AC mixed 5G band only (Only 11AC chipset support)

2.2.7 Channel

Description: WLAN Radio channel (2.4G Band or 5G band)
Value:

Channel=0

Note:
The range of configurable values depends on CountryRegion or CountryRegionForABand
Its default value is zero and the driver configures a working channel automatically

2.2.8 AutoChannelSelect

Description: Algorithm configuration of automatic channel selection
Value:

AutoChannelSelect=1

0: Disable
1: Old Channel Selection Algorithm (AP count)
2: New Channel Selection Algorithm (CCA)

2.2.9 AutoChannelSkipList

Description: Configure channels you want to skip when Auto Channel Selection is enabled
Value:

AutoChannelSkipList=<channel_list>

Example:

<channel_list>=2;3;4;5;7;8;10;

MEDIATEK CONFIDENTIAL
FOR wang.xiasheng@utt.com.cn USE ONLY

Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.

2.2.10 ACSCheckTime

Description: Configuration of periodic check time for automatic channel selection
Value:

iwpriv ra0 set ACSCheckTime=1

0: Disable

Note: Unit is hour

2.2.11 BasicRate

Description: Basic rate support
Value:

BasicRate=15

0~4095

Note:
A bitmap represent basic support rate
1: Basic rate-1Mbps
2: Basic rate-2Mbps
3: Basic rate-1Mbps, 2Mbps
4: Basic rate-5.5Mbps
15: Basic rate-1Mbps, 2Mbps, 5.5Mbps, 11Mbps

Examples:

Basic Rate Bit Map (max. 12-bit, represent max. 12 basic rates)												
Bit	11	10	9	8	7	6	5	4	3	2	1	0
Rate	54	48	36	24	18	12	9	6	11	5.5	2	1
Set	0	1	0	1	0	1	0	1	1	1	1	1
Hex	5				5				F			
Decimal	1375											

Note:
Set correct basic rate set before changing wireless mode.

2.2.12 SupportRate

Description: Maximum support rate configuration for 11bg
Value:

SupportRate=0xFFF

Legacy Rate Bit Map (max. 12-bit, represent max. 12 basic rates)												
Bit	11	10	9	8	7	6	5	4	3	2	1	0
Rate	54	48	36	24	18	12	9	6	11	5.5	2	1
Set	1	1	1	1	1	1	1	1	1	1	1	1
Hex	F				F				F			

Note:
Unlike BasicRate, the SupportRate bitmap must be composed of consecutive 1s.

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.
MEDIATEK CONFIDENTIAL
FOR wang.xiansheng@utt.com.cn USE ONLY

For example, if SupportRate=0x7F, it means the maximum support rate is OFDM 12M.
Also, this settings will be applied globally which means no per-SSID configuration is allowed.
Only RT5x92 supports this. Its macro is DYNAMIC_RX_RATE_ADJ.

2.2.13 SupportHTRate

Description: Maximum support rate configuration for 11n
Value:

SupportHTRate=0xFFFF

HTRate Bit Map (max. 16-bit, represent max. 16 rates)																
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
MCS	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Set	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
Hex	F				F				F				F			

Note:
Unlike BasicRate, the SupportHTRate bitmap must be composed of consecutive 1s.
For example, if SupportHTRate=0x7F, it means the maximum support rate is MCS 6.
Also, this settings will be applied globally which means no per-SSID configuration is allowed.
Only RT5x92 supports this. Its macro is DYNAMIC_RX_RATE_ADJ.

2.2.14 BeaconPeriod

Description: Beacon period configuration (It is SoftAP only)
Value:

BeaconPeriod=100

2.2.15 DtimPeriod

Description: DTIM period
Value:

DtimPeriod=1

1~255

2.2.16 TxPower

Description: WLAN Radio Transmit Power setting in percentage
Value:

TxPower=100

0~100

2.2.17 DisableOLBC

Description: Enable or disable OLBC (Overlapping Legacy BSS Condition)
Value:

DisableOLBC=0

0: disable
1: enable

2.2.18 BGProtection

Description: Enable/disable WLAN 11B or 11G protection
Value:

BGProtection=0

0: AUTO
1: On
2: Off

2.2.19 MaxStaNum

Description: Configure maximun number of station that could connect with this SoftAP
Value:

MaxStaNum=0

0: disable
1~32

2.2.20 TxAntenna

Description: Configure Tx antenna number
Value:

TxAntenna=1

1: 1Tx1R
2: 2Tx2R
3: 3Tx3R

2.2.21 RxAntenna

Description: Configure Rx antenna number
Value:

2.2.27 NoForwarding

Description: Enable or disable No-Packet-Forwarding within a BSSID
Value:

NoForwarding=0

0: disable
1: enable

2.2.28 NoForwardingBTNBSSID

Description: Enable or disable No-Packet-Forwarding between each BSSID
Value:

NoForwardingBTNBSSID=0

0: disable
1: enable

2.2.29 NoForwardingMBCast

Description: Enable or disable No-MC-BC-Packet-Forwarding within a BSSID
Value:

NoForwardingMBCast=0

0: disable
1: enable

2.2.30 HideSSID

Description: Enable or disable stopping sending Beacons to hide SSID
Value:

HideSSID=0

0: disable
1: enable

2.2.31 StationKeepAlive

Description: Enable or disable auto detection of aliveness of connected stations periodically
Value:

StationKeepAlive=0

0: disable
1~65535 seconds

0: 20 MHz
1: 20/40 MHz

2.2.48 HT_PROTECT

Description: Enable or disable 802.11n protection mechanism
Value:

HT_PROTECT=1

0: disable
1: enable

2.2.49 HT_BSSCoexistence

Description: Enable or disable HT BSS coexistence support
Value:

HT_BSSCoexistence=1

0: disable
1: enable

2.2.50 HT_TxStream

Description: Configure the number of spatial streams for transmission
Value:

HT_TxStream=2

1~4: valid spatial streams

2.2.51 HT_RxStream

Description: Configure the number of spatial streams for reception
Value:

HT_RxStream=2

1~4: valid spatial streams

Note: MT7615 chipset only

The TX/RX information is in EEPROM offset 0x34. The TX/RX information in EEPROM indicates the HW capability. It has the highest priority. The TX/RX configuration in profile cannot exceed the EEPROM settings. If TX/RX configuration in profile exceeds EEPROM settings, the driver will apply the EEPROM value

2.2.54 HT_AMSDU

Description: Enable or disable AMSDU transmission
Value:

HT_AMSDU=0

0: disable
1: enable

2.2.55 HT_BAWinSize

Description: Block Ack window size configuration
Value:

HT_BAWinSize=64

1~64

2.2.56 HT_GI

Description: HT guard interval configuration
Value:

HT_GI=1

0: LGI (long guard interval)
1: SGI (short guard interval)

2.2.57 HT_MCS

Description: Modulation and Coding Scheme (MCS) configuration
Value:

HT_MCS=33

0 ~15, 32: Fix MCS rate for HT rate.
33: Auto Rate Adaption, recommended

2.2.58 HT_MIMOPSMode

Description: 802.11n SM power save mode
Value:

HT_MIMOPSMode=3

0: Static SM Power Save Mode
2: Reserved
1: Dynamic SM Power Save Mode
3: SM enabled
(not fully support yet)

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.

2.2.59 HT_DisallowTKIP

Description: Enable or disable 11N rate with 11N AP when cipher is TKIP or WEP
Value:

HT_DisallowTKIP=1

0: disable
1: enable

2.2.60 HT_STBC

Description: Enable or disable HT STBC support
Value:

HT_STBC=0

0: disable
1: enable

2.2.61 HT_LDPC

Description: Enable or disable HT LDPC support
Value:

HT_LDPC=0

0: disable
1: enable

Note: MT76x2E chipset only

2.2.62 VHT_BW

Description: Enable or disable 11ac 80MHz bandwidth
Value:

VHT_BW=3

0: disable
1: 80 Mhz
2: 160nc(80+80) Mhz
3: 160c Mhz

Note: 1 : 11AC chipset only
2~3 : MT7615 only

2.2.63 VHT_SGI

Description: VHT Guard Interval support configuration
Value:

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.
MEDIATEK CONFIDENTIAL
FOR wang.xiansheng@ utt.com.cn USE ONLY

VHT_SGI=1

0: Long guard interval
1: Short guard interval

Note: 11AC chipset only

2.2.64 VHT_STBC

Description: Enable or disable 11ac STBC
Value:

VHT_STBC=1

0: disable
1: enable

Note: 11AC chipset only

2.2.65 VHT_BW_SIGNAL

Description: Enable or disable 11ac bandwidth signaling
Value:

VHT_BW_SIGNAL=1

0: disable
1: enable

Note: 11AC chipset only

2.2.66 VHT_LDPC

Description: Enable or disable LDPC on received packets with 11ac MCS
Value:

VHT_LDPC=1

0: disable
1: enable

Note: 11AC chipset only

2.2.67 VHT_DisallowNonVHT

Description: Enable or disable the function of rejecting connection attempt from non-VHT STA
Value:

VHT_DisallowNonVHT=1

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.
MEDIATEK CONFIDENTIAL
FOR wang.xiansheng@utt.com.cn USE ONLY

0: disable
1: enable

Note: 11AC chipset only

2.2.68 VLANID

Description: set VLAN ID
Value:

VLANID=0

0: Disable

2.2.69 VLANPriority

Description: set VLAN Priority
Value:

VLANPriority=0

0: Disable

2.2.70 E2pAccessMode

Description: Select the EEPROM access mode from interface start-up
Value:

E2pAccessMode=2

0: NONE
1: EFUSE mode
2: FLASH mode
3: EEPROM mode
4: BIN FILE mode

2.2.71 EntryLifeCheck

Description: Set how many continued TX failure packets per STA can be ignored. Over the value, AP will tear down this STA, because it shall be gone.
Value:

EntryLifeCheck=20

Example:
EntryLifeCheck=1 ~ 65535. Default is 20.

2.2.72 EtherTrafficBand

Description: To bind enthernet packets with specific RF band

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.
MEDIATEK CONFIDENTIAL
FOR wang.xiansheng@ utt.com.cn USE ONLY

Value:

EtherTrafficBand=2G

2G: Bind enthernet packets with 2.4GHz RF Band
5G: Bind enthernet packets with 5GHz RF Band

Note: only available after SoftAP driver v3.0.1.2. or later version

2.3 WAPI Specific

2.3.1 Wapiifname

Description: Assign an interface name to process the WAI frame. The WAPID daemon shall be bound on this interface. If it doesn't specify, the default interface is "br0".
Value:

br0: default binding interface

2.3.2 WapiAsCertPath

Description: Assign the path of the AS certificate for the WAPI certificate authentication.
Value:

WapiAsCertPath=/etc/as.cer

2.3.3 WapiAsIpAddr

Description: Assign the IP address of the AS for the WAPI certificate authentication.
Value:

WapiAsIpAddr=192.168.222.174

2.3.4 WapiAsPort

Description: Assign the port number of the AS for the WAPI certificate authentication.
Value:

WapiAsPort=3810

2.3.5 WapiMskRekeyMethod

Description: Set the method for WAPI group key renew mechanism
Value:

DISABLE : Disable the rekey mechanism

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.
FOR wang xianshen@ utt.com.cn USE ONLY MEDIATEK CONFIDENTIAL

TIME : time-based
PKT : packet-based

2.3.6 WapiMskRekeyThreshold

Description: Set the period of WAPI group key updating
Value:

0 : Disable this mechanism
10 ~ 0x3ffffff, Default is 3600.

2.3.7 WapiPsk1

Description: Set the WAPI pre-shared key
Value:

8~64 characters

2.3.8 WapiPskType

Description: Set the WAPI key type
Value:

0: HEX mode
1: ASCII mode

2.3.9 WapiUserCertPath

Description: Assign the path of the user certificate for the WAPI certificate authentication
Value:

WapiUserCertPath=/etc/user.cer

2.3.10 WapiUskRekeyMethod

Description: Set the method for WAPI unicast key renew mechanism
Value:

DISABLE : Disable the rekey mechanism
TIME : time-based
PKT : packet-based

2.3.11 WapiUskRekeyThreshold

Description: Set the period of WAPI unicast key updating

3 WLAN SoftAP Driver iwpriv set command

Syntax is iwpriv ra0 set [parameters]=[Value]

Note: Execute one iwpriv/set command at a time.

3.1.1 Debug

Description: config WLAN driver Debug level.
Value:

iwpriv ra0 set Debug=3

0~5
0: Debug Off
1: Debug Error
2: Debug Warning
3: Debug Trace
4: Debug Info
5: Debug Loud

3.1.2 DriverVersion

Description: Check driver version by iwpriv command. (Need to enable debug mode)
Value:

iwpriv ra0 set DriverVersion=0

Any value

3.1.3 CountryRegion

Description: Country region for WLAN radio 2.4 GHz regulation (G band)
Value:

iwpriv ra0 set CountryRegion=5

Region	Channels
0	1-11
1	1-13
2	10-11
3	10-13
4	14
5	1-14 all active scan
6	3-9
7	5-13
31	1-11 active scan, 12-14 passive scan
32	1-11 active scan, 12-13 passive scan

33	1-14 all active scan, 14 b mode only

3.1.4 CountryRegionABand

Description: Country region for WLAN radio 5 GHz regulation (A band)
Value:

iwpriv rai0 set CountryRegionABand=7

Region	Channels
0	36, 40, 44, 48, 52, 56, 60, 64, 149, 153, 157, 161, 165
1	36, 40, 44, 48, 52, 56, 60, 64, 100, 104, 108, 112, 116, 120, 124, 128, 132, 136, 140
2	36, 40, 44, 48, 52, 56, 60, 64
3	52, 56, 60, 64, 149, 153, 157, 161
4	149, 153, 157, 161, 165
5	149, 153, 157, 161
6	36, 40, 44, 48
7	36, 40, 44, 48, 52, 56, 60, 64, 100, 104, 108, 112, 116, 120, 124, 128, 132, 136, 140, 149, 153, 157, 161, 165
8	52, 56, 60, 64
9	36, 40, 44, 48, 52, 56, 60, 64, 100, 104, 108, 112, 116, 132, 136, 140, 149, 153, 157, 161, 165
10	36, 40, 44, 48, 149, 153, 157, 161, 165
11	36, 40, 44, 48, 52, 56, 60, 64, 100, 104, 108, 112, 116, 120, 149, 153, 157, 161
12	36, 40, 44, 48, 52, 56, 60, 64, 100, 104, 108, 112, 116, 120, 124, 128, 132, 136, 140, 144
13	36, 40, 44, 48, 52, 56, 60, 64, 100, 104, 108, 112, 116, 120, 124, 128, 132, 136, 140, 144, 149, 153, 157, 161, 165
14	36, 40, 44, 48, 52, 56, 60, 64, 100, 104, 108, 112, 116, 132, 136, 140, 144, 149, 153, 157, 161, 165

3.1.5 CountryCode

Description: County code for WLAN radio regulation
Value:

iwpriv ra0 set CountryCode=TW

Note:
2 characters, like TW for Taiwan.
Please refer to the following link for ISO3166 code list for other countries.
http://www.iso.org/iso/prods-services/iso3166ma/02iso-3166-code-lists/country_names_and_code_elements

3.1.6 AccessPolicy

Description: Configure access policy of ACL table
Value:

iwpriv ra0 set AccessPolicy=0

0: Disable this function
1: Allow all entries of ACL table to associate AP
2: Reject all entries of ACL table to associate AP

3.1.7 ResetCounter

Description:Reset all statistic counter

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.
MEDIATEK CONFIDENTIAL
FOR wang.xiaofeng@ ... .com.cn USE ONLY

Value:

iwpriv ra0 set ResetCounter=1

3.1.8 SiteSurvey

Description: Make a site survey request to the driver

Value:

iwpriv ra0 set SiteSurvey=

Note:

Passive scan: Use empty string as argument, like “iwpriv ra0 set SiteSurvey=”

Active scan: Use legal SSID as argument, like “iwpriv ra0 set SiteSurvey=Target_SSID”

3.1.9 CountryString

Description: configure country string

Value:

iwpriv ra0 set CountryString=TAIWAN

32 characters, ex:Taiwan, case insensitive

Note: Please refer to ISO3166 code list for other countries and can be found at http://www.iso.org/iso/en/prods-services/iso3166ma/02iso-3166-code-lists/list-en1.html#sz

3.1.10 SSID

Description: Set AP SSID
Value:

iwpriv ra0 set SSID=11n-AP

0~z, 1~32 ASCII characters

3.1.11 WirelessMode

Description: WLAN mode configuration
Value:

iwpriv ra0 set WirelessMode=9

0: legacy 11b/g mixed
1: legacy 11b only
2: legacy 11a only
3: legacy 11a/b/g mixed
4: legacy 11g only
5: 11abgn mixed
6: 11n only in 2.4g band
7: 11gn mixed
8: 11an mixed
9: 11bgn mixed
10: 11AGN mixed
11: 11n only in 5g band
14: 11A/AN/AC mixed 5G band only (Only 11AC chipset support)
15: 11 AN/AC mixed 5G band only (Only 11AC chipset support)

3.1.12 FixedTxMode

Description: Fix Tx mode to CCK or OFDM for MCS rate selection
Value:

iwpriv ra0 set FixedTxMode=CCK

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.
MEDIATEK CONFIDENTIAL

CCK
OFDM
HT

3.1.13 BasicRate

Description: configure basic rate
Value:

iwpriv ra0 set BasicRate=

0~4095

Basic Rate Bit Map (max. 12-bit, represent max. 12 basic rates)												
Bit	11	10	9	8	7	6	5	4	3	2	1	0
Rate	54	48	36	24	18	12	9	6	11	5.5	2	1
Set	0	1	0	1	0	1	0	1	1	1	1	1
Hex	5				5				F			
Decimal	1375											

Note: Be careful to set this value, if you don't know what this is, please don't set this field.

3.1.14 Channel

Description: WLAN Radio channel (2.4G Band or 5G band)
Value:

iwpriv ra0 set Channel=6

Note:
The range of configurable values depends on CountryRegion or CountryRegionForABand

3.1.15 AutoChannelSel

Description: Algorithm configuration of automatic channel selection
Value:

iwpriv ra0 set AutoChannelSel=2

0: Disable
1: Old Channel Selection Algorithm (AP count)
2: New Channel Selection Algorithm (CCA)

3.1.16 ACSCheckTime

Description: Configuration of periodic check time for automatic channel selection
Value:

iwpriv ra0 set ACSCheckTime=1

0: Disable

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.

Note: Unit is hour

3.1.17 BeaconPeriod

Description: configure Beacon period
Value:

iwpriv ra0 set BeaconPeriod=100

20 ~ 1024 (unit is in milli-seconds)

3.1.18 DtimPeriod

Description: Configure DTIM period
Value:

iwpriv ra0 set DtimPeriod=1

1~5

3.1.19 TxPower

Description: Set Transmit Power by percentage
Value:

iwpriv ra0 set TxPower=100

0~100

Note:

91 ~ 100% & AUTO, treat as 100% in terms of mW	
61 ~ 90%, treat as 75% in terms of mW	-1dBm
31 ~ 60%, treat as 50% in terms of mW	-3dBm
16 ~ 30%, treat as 25% in terms of mW	-6dBm
10 ~ 15%, treat as 12.5% in terms of mW	-9dBm
0 ~ 9 %, treat as MIN(~3%) in terms of mW	-12dBm

3.1.20 BGProtection

Description: Enable or disable 11bg protection
Value:

iwpriv ra0 set BGProtection=0

0: disable
1: Always on
2: Always off

3.1.21 DisableOLBC

Description: Enable or disable OLBC

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.
MEDIATEK CONFIDENTIAL
FOR wang.xiansheng@utt.com.cn USE ONLY

Value:

iwpriv ra0 set DisableOLBC=0

0: disable
1: enable

3.1.22 TxPreamble

Description: enable or disable Tx preamble
Value:

iwpriv ra0 set TxPreamble=1

0: disable
1: enable

3.1.23 RTSThreshold

Description: Set RTS Threshold
Value:

iwpriv ra0 set RTSThreshold=2347

1~2347

3.1.24 FragThreshold

Description: Set Fragment threshold
Value:

iwpriv ra0 set FragThreshold=2346

256~2346

3.1.25 TxBurst

Description: enable or disable Tx burst mode
Value:

iwpriv ra0 set TxBurst=0

0: disable
1: enable

3.1.26 PktAggregate

Description: enable or disable packet aggregation (Ralink to Ralink only)
Value:

iwpriv ra0 set PktAggregate=1

This document contains information that is proprietary to MediaTek Inc.

3.1.32 DisConnectSta

Description: Disconnect one specific STA which connected with this SoftAP manually
Value:

iwpriv ra0 set DisConnectSta=00:11:22:33:44:55

[MAC address]

3.1.33 DisConnectAllSta

Description: Disconnect all STAs which connected with this SoftAP manually
Value:

iwpriv ra0 set DisConnectAllSta=1

1: disconnect all STAs

3.1.34 McastPhyMode

Description: Configure multicast physical mode
Value:

iwpriv ra0 set McastPhyMode=0

0: Disable
1: CCK
2: OFDM
3: HTMIX

3.1.35 McastMcs

Description: Specify the MCS of multicast packets.
Value:

iwpriv ra0 set McastMcs=0

0~15

3.1.36 MaxStaNum

Description: To limit the maximum number of associated clients per BSS.
Value:

iwpriv ra0 set MaxStaNum=0

0: disable this function
1~32 (default:32)

1: enable

3.1.38 GreenAP

Description: enable or disable Green AP fucntion
Value:

iwpriv ra0 set GreenAP=0

0: disable
1: enable

3.1.39 MBSSWirelessMode

Description: Set MBSS Wireless phy Mode. Only support in v2.5.0.0 and after version.
Value:

0: 802.11 B/G mixed
1: 802.11 B only
2: 802.11 A only
4: 802.11 G only
6: 802.11 N only
7: 802.11 G/N mixed
8: 802.11 A/N mixed
9: 802.11 B/G/N mixed
10: 802.11 A/G/N mixed
11: 802.11 N in 5G band only

Example:

ra0: B/G/N fixed
ra1: B only
ra2: B/G mixed
ra3: G only
Must set main BSS (ra0) first then set other MBSS WirelessMode.
Can't have A & B mode fixed in MBSS.

iwpriv ra0 set WirelessMode=9
iwpriv ra1 set MBSSWirelessMode=1
iwpriv ra2 set MBSSWirelessMode=0

4 Other iwpriv Command

4.1 stat

Description: Show WLAN statistics
Value:

iwpriv ra0 stat

Note:
You can use “iwpriv ra0 set ResetCounter=1” to reset statistics
Also, you can use the following command line shell script to get per-second statistics.
while [1]; do iwpriv ra0 set ResetCounter=1; sleep 1; iwpriv ra0 stat; done;

4.2 get_site_survey

Description: Show site survey result
Value:

iwpriv ra0 get_site_survey

Note: You need to use “iwpriv ra0 set SiteSurvey=” to collect information first

4.3 get_mac_table

Description: Show MAC addresses of connected stations
Value:

iwpriv ra0 get_mac_table

4.4 get_ba_table

Description: Show raw data of the BlockAck table
Value:

iwpriv ra0 get_ba_table

4.5 get_wsc_profile

Description: Show WPS profile information
Value:

iwpriv ra0 get_wsc_profile

4.6 e2p

Description: Read/Write EEPROM content
Value:

iwpriv ra0 e2p offset=value

Note:

offset = hexidecimal address
value = hexidecimal value

4.7 show

You could use iwpriv ra0 show command to display general or specific information. As to specific information, you have to turn on the corresponding function in driver config.

[Format]
iwpriv ra0 show [parameter]

[Parameter list]

1. driverinfo - show driver version
2. stat - show statistics counter
3. stainfo - show MAC address of associated STAs
4. stacountinfo - show TRx byte count of associated STAs
5. stasecinfo - show security information of associated STAs
6. bainfo - show BlockAck information
7. connStatus - show AP-Client connection status
8. reptinfo - show MAC Repeater information
9. wdsinfo - show WDS link list
10. igmpinfo - show all entries in the IGMP Snooping Table
11. mbss - show MBSS PHY mode information
12. blockch - show DFS blocked channel list

[Example]
iwpriv ra0 show driverinfo
Driver version: 2.7.1.6

5 MBSSID

The Multiple BSSID (MBSSID) function is a feature providing additional virtual WLANs which look like real WLANs to users. Its common application is to create one Main and several Guest Networks simultaneously. You may setup each BSSID with different configuration.

5.1 How to Setup

Please turn on MBSS_SUPPORT in driver config.

We also suggest turn on NEW_MBSSID_MODE which changes how the driver creates extended MAC addresses for these virtual BSSID.

5.2 Parameter in RT2860AP.dat

5.2.1 BssidNum

Description: Multiple BSSID number configuration
Value:

BssidNum=1

1/2/4/8/16

Note:

1. It depends on MBSS_SUPPORT
2. It should be placed before other configuration in the profile
3. 16-BSSID is supported only in new products

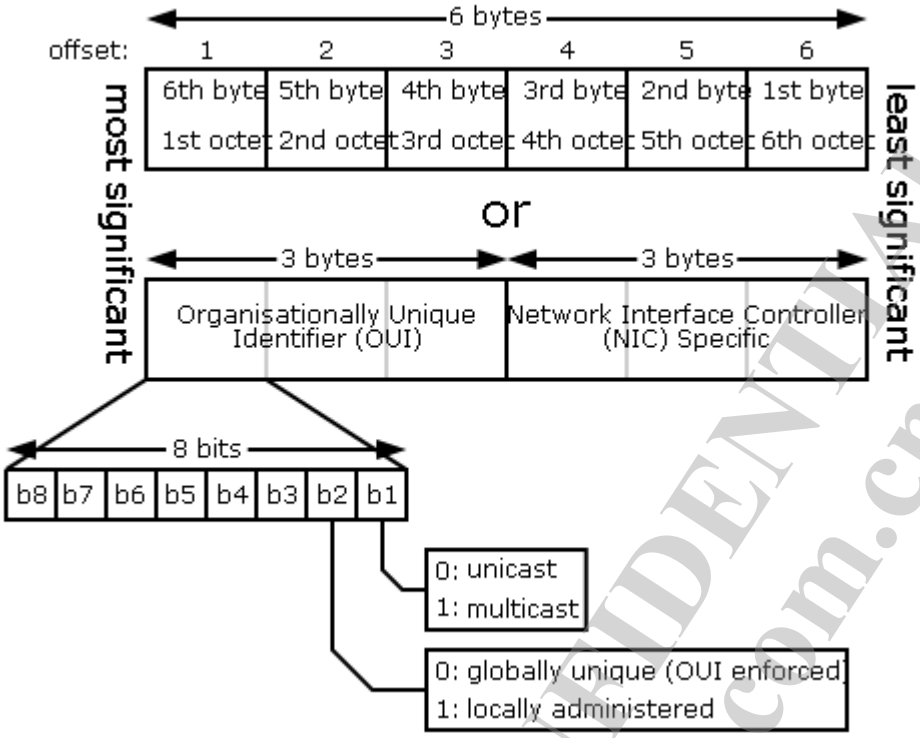
5.3 Important Note

5.3.1 MAC Address Format

The following MAC address format figure is from http://en.wikipedia.org/wiki/MAC_address and all subsequent discussion is based on this format.

MEDIATEK CONFIDENTIAL
FOR wang.xiansheng@ utt.com.cn USE ONLY

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.



5.3.2 Old MBSSID Mode

As to main BSSID, **the 1st byte** of its MAC address should be:

- Multiple of 2 for 2-BSSID
- Multiple of 4 for 4-BSSID
- Multiple of 8 for 8-BSSID

Taking BssidNum=4 for example, address extension would be done on 1st byte.

- ra0: 00:0c:43:00:00:**00** 00 is multiple of 4
- ra1: 00:0c:43:00:00:**01** 01 comes from (1st byte 0x00) + 0x01
- ra2: 00:0c:43:00:00:**02** 02 comes from (1st byte 0x00) + 0x02
- ra3: 00:0c:43:00:00:**03** 03 comes from (1st byte 0x00) + 0x03

Other possible address extension:

Multiple of 4	1st BSSID	2nd BSSID	3rd BSSID	4th BSSID
0x00	AA-BB-CC-DD-EE-F0	AA-BB-CC-DD-EE-F1	AA-BB-CC-DD-EE-F2	AA-BB-CC-DD-EE-F3
0x04	AA-BB-CC-DD-EE-F4	AA-BB-CC-DD-EE-F5	AA-BB-CC-DD-EE-F6	AA-BB-CC-DD-EE-F7
0x08	AA-BB-CC-DD-EE-F8	AA-BB-CC-DD-EE-F9	AA-BB-CC-DD-EE-FA	AA-BB-CC-DD-EE-FB
0x0C	AA-BB-CC-DD-EE-FC	AA-BB-CC-DD-EE-FD	AA-BB-CC-DD-EE-FE	AA-BB-CC-DD-EE-FF

Please be noted that all these MAC addresses should be reserved because they are global MAC addresses.

MEDIATEK CONFIDENTIAL
FOR wangyanshen@utt.com.cn USE ONLY

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.

5.3.3 New MBSSID Mode

Since there is MAC address reservation problem in the old MBSSID mode, we provide the new MBSSID mode which will utilize **b2 of 6th byte** of a virtual MAC address to claim it as locally administered. Address extension would be done on 6th byte. This is supported in 5-series products.

Taking BssidNum=4 for example:

- ra0: 0**0**:0c:43:00:00:00
- ra1: 0**2**:0c:43:00:00:00 — 0**2** comes from (6th byte 0x00 | b'000000**1**0)
- ra2: 0**6**:0c:43:00:00:00 — 0**6** comes from (6th byte 0x00 | b'000001**1**0)
- ra3: 0**a**:0c:43:00:00:00 — 0**a** comes from (6th byte 0x00 | b'000010**1**0)

5.3.4 Enhanced New MBSSID Mode

The enhanced new MBSSID mode removes the restriction of using the 6th byte since OUI (Consists of 6th, 5th, 4th bytes) is not controllable. Local Administration bit would be turned on and address extension would be done on 3rd byte. The extension algorithm is **(3rd Byte & MacMSK) + (idx)**. BssidNum will affect MacMSK. This is supported only in new 7-series products and will be turned on by default.

```
if (BssidNum <= 2)        { MacMSK  = b'1111111 0;}
else if (BssidNum <= 4)   { MacMSK  = b'111111 00;}
else if (BssidNum <= 8)   { MacMSK  = b'11111 000;}
else if (BssidNum <= 16)  { MacMSK  = b'1111 0000;}
```

Taking BssidNum=4 for example:

- ra0: 00:0c:43:0**0**:00:00
- ra1: 0**2**:0c:43:0**0**:00:00 — 00 comes from (3rd byte 0x00 & 0xfb) + 0x00
- ra2: 0**2**:0c:43:0**1**:00:00 — 01 comes from (3rd byte 0x00 & 0xfb) + 0x01
- ra3: 0**2**:0c:43:0**2**:00:00 — 02 comes from (3rd byte 0x00 & 0xfb) + 0x02

MT7603 and MT7628 take a little different policy which uses **first 4 bits** of 3rd byte to do extension. The extension algorithm is **(3rd Byte & MacMSK) + (idx << 4)**.

```
if (BssidNum <= 2)        { MacMSK  = b'1110 1111;}
else if (BssidNum <= 4)   { MacMSK  = b'1100 1111;}
else if (BssidNum <= 8)   { MacMSK  = b'1000 1111;}
else if (BssidNum <= 16)  { MacMSK  = b'0000 1111;}
```

Taking BssidNum=4 for example:

- ra0: 00:0c:43:**0**0:00:00
- ra1: 0**2**:0c:43:**1**0:00:00 — 10 comes from (3rd byte 0x00 & 0xbf) + (0x01 << 4)
- ra2: 0**2**:0c:43:**2**0:00:00 — 20 comes from (3rd byte 0x00 & 0xbf) + (0x02 << 4)
- ra3: 0**2**:0c:43:**3**0:00:00 — 30 comes from (3rd byte 0x00 & 0xbf) + (0x03 << 4)

5.3.5 Address Confliction Problem

In this section, we'll explain the address conflication problem.

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.
FOR MEDIATEK CONFIDENTIAL USE ONLY
for wang.xiansheng@mtt.com.cn

Suppose we have four DUTs with the following global MAC addresses.

DUT-A: 00:0c:43:10:22:33
DUT-B: 00:0c:43:11:22:33
DUT-C: 00:0c:43:12:22:33
DUT-D: 00:0c:43:13:22:33

Each DUT turns on MBSSID and its BssidNum=4. As a result, you will get the following total 16 MAC addresses.

	1st BSSID	2nd BSSID	3rd BSSID	4th BSSID
DUT-A	00:0c:43:10:22:33	02:0c:43:11:22:33	02:0c:43:12:22:33	02:0c:43:13:22:33
DUT-B	00:0c:43:11:22:33	02:0c:43:11:22:33	02:0c:43:12:22:33	02:0c:43:13:22:33
DUT-C	00:0c:43:12:22:33	02:0c:43:11:22:33	02:0c:43:12:22:33	02:0c:43:13:22:33
DUT-D	00:0c:43:13:22:33	02:0c:43:11:22:33	02:0c:43:12:22:33	02:0c:43:13:22:33

The 2nd, 3rd and 4th BSSID are exactly identical for these DUTs. So, the address conflict problem does exist but the conflicting rate is extremely low. Using local MAC address as BSSID, this problem is inevitable.

5.4 Configuration

BssidNum can be configured only through profile and you must restart the interface to make it to work. Other parameters can be configured dynamically through iwpriv command per interface. MBSSID-supported parameters are SSID, AuthMode, EncrypType, WPAPSK, etc.

5.4.1 Example

BssidNum=4
SSID=SSID_A;SSID_B;SSID_C;SSID_D
AuthMode=OPEN;SHARED;WPAPSK;WPA2PSK
EncrypType=NONE;WEP;TKIP;AES

6 WPS

Wi-Fi Protected Setup (WPS) also known as Wi-Fi Simple Configuration (WSC)

6.1 Architectural Overview

This section presents high-level description of the Wi-Fi Simple Configuration architecture. Most material is taken directly from the WSC specification. In the following figure, you can see that there are three logical components involved in WSC: the Registrar, the access point (AP), and the Enrollee.

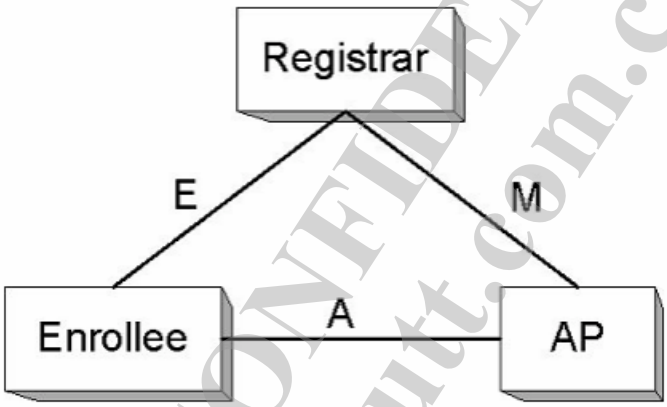

Figure 1: Components and Interfaces

[Component]

The **Enrollee** is a device seeking to join a WLAN domain. Once an Enrollee obtains a valid credential, it becomes a member.

The **Registrar** is an entity with the authority to issue and revoke domain credentials. A registrar may be integrated into an AP, or it may be separate from the AP.

The **AP** is an infrastructure mode 802.11 Access Point. We also call it **Proxy**.

[Interface]

Interface E is logically located between the Enrollee and the Registrar and its purpose is to enable the Registrar to discover and issue WLAN credentials to the Enrollee.

Interface M is between the AP and the Registrar and it enables an external Registrar to manage a WSC AP.

Interface A is between the Enrollee and the AP and it enables discovery of the WSC WLAN and communication between the Enrollee and IP-only Registrars.

6.2 Parameters in RT2860AP.dat

6.2.1 WscConfMode

Description: Configure WPS role (bitwise OR)
Value:

WscConfMode=7

b'000: 0 Disable
b'001: 1 Enrollee
b'010: 2 Proxy
b'100: 4 Registrar

6.2.2 WscConfStatus

Description: Configure WPS state
Value:

WscConfStatus=1

1: AP is unconfigured
2: AP is configured

6.2.3 WscConfMethods

Description: Setup the configuration methods which Enrollee or Registrar supports
Value:

WscConfMethods=238c

Note:

Hexadecimal value only.
// Bitwise OR all values which DUT supports
0x238c = 0x2008 + 0x0280 + 0x0100 + 0x0004
Virtual Display PIN + Virtual Push Button + Keypad + Label PIN

Config Method	Value
Label PIN	0x0004
External NFC Token	0x0010
Integrated NFC Token	0x0020
NFC Interface	0x0040
Keypad	0x0100
Virtual Push Button	0x0280
Physical Push Button	0x0480
Virtual Display PIN	0x2008
Physical Display PIN	0x4008

MEDIATEK CONFIDENTIAL
FOR Wangjiansheng@utt.com.cn USE ONLY

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.

6.2.4 WscKeyASCII

Description: Choose the format/length of a generated key for an un-configured AP (internal registrar)
Value:

WscKeyASCII=0

0: Hex (64-bytes)
1: ASCII (Random length)
8 ~ 63: ASCII length

6.2.5 WscSecurityMode

Description: Configure the security mode which AP would use when being configured
Value:

WscSecurityMode=0

0: WPA2PSK AES
1: WPA2PSK TKIP
2: WPAPSK AES
3: WPAPSK TKIP

6.2.6 Wsc4digitPinCode

Description: Configure whether to use 4-digit PIN code
Value:

Wsc4digitPinCode=1

0: 8-digit PIN code
1: 4-digit PIN code

6.2.7 WscVendorPinCode

Description: Configure a fixed PIN code which AP would use as an Enrollee
Value:

WscVendorPinCode=[xxxx|yyyyyyyy]

xxxx is a 4-digit PIN code
yyyyyyyy is a 8-digit PIN code

6.2.8 WscDefaultSSID0

Description: Configure the SSID which AP would use after being configured
Value:

WscDefaultSSID0=SSID

1~32 characters

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.
FOR wang.jiansheng@utt.com.cn USE ONLY
MEDIATEK CONFIDENTIAL

6.2.9 WscV2Support

Description: Enable or disable WPS v2.0 support
Value:

WscV2Support=1

0: disable
1: enable

6.2.10 WscManufacturer

Description: WPS manufacturer string
Value:

WscManufacturer=

Less than 64 characters

6.2.11 WscModelName

Description: WPS model name string
Value:

WscModelName=

Less than 32 characters

6.2.12 WscDeviceName

Description: WPS device name string
Value:

WscDeviceName=

Less than 32 characters

6.2.13 WscModelNumber

Description: WPS model number string
Value:

WscModelNumber=

Less than 32 characters

6.2.14 WscSerialNumber

Description: WPS serial number string
Value:

WscSerialNumber=

This document contains information that is proprietary to MediaTek Inc.

MEDIATEK CONFIDENTIAL
FOR wang.xiansheng@ utt.com.cn USE ONLY

Less than 32 characters

6.3 WPS iwpriv command

6.3.1 WscConfMode

Description: Configure WPS role (bitwise OR)
Value:

iwpriv ra0 set WscConfMode=7

b’000: 0 Disable
b’001: 1 Enrollee
b’010: 2 Proxy
b’100: 4 Registrar

6.3.2 WscConfStatus

Description: Configure WPS state
Value:

iwpriv ra0 set WscConfStatus=1

1: AP is unconfigured
2: AP is configured

6.3.3 WscMode

Description: Configure WPS mode
Value:

iwpriv ra0 set WscMode=1

1: PIN Mode
2: PBC Mode

6.3.4 WscGetConf

Description: Trigger WPS action
Value:

iwpriv ra0 set WscGetConf=1

6.3.5 WscStop

Description: Stop WPS process
Value:

iwpriv ra0 set WscStop=1

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.
MEDIATEK CONFIDENTIAL
FOR wang.xiansheng@utt.com.cn USE ONLY

6.3.6 WscPinCode

Description: Input Enrollee's PIN code which AP would use as a Registrar
Value:

iwpriv ra0 WscPinCode=[xxxx|yyyyyyyy]

xxxx is a 4-digit PIN code
yyyyyyyy is a 8-digit PIN code

6.3.7 WscGenPinCode

Description: Generate random PIN code which AP would use as an Enrollee
Value:

iwpriv ra0 set WscGenPinCode=1

Note:

PIN code can be either 4-digit or 8-digit depending on Wsc4digitPinCode
One of the digits in the 8-digit PIN code is used as a checksum

6.3.8 WscVendorPinCode

Description: Configure a fixed PIN code which AP would use as an Enrollee
Value:

iwpriv ra0 set WscVendorPinCode=[xxxx|yyyyyyyy]

xxxx is a 4-digit PIN code
yyyyyyyy is a 8-digit PIN code

6.3.9 WscSecurityMode

Description: Configure the security mode which AP would use when being configured
Value:

iwpriv ra0 set WscSecurityMode=0

0: WPA2PSK AES
1: WPA2PSK TKIP
2: WPAPSK AES
3: WPAPSK TKIP

6.3.10 WscOOB

Description: Reset WPS AP to the OOB (out-of-box) state
Value:

iwpriv ra0 set WscOOB=1

Note:

<OOB settings>

6.3.12 WscMultiByteCheck

Description: Enable or disable multi-byte check
Value:

iwpriv ra0 set WscMultiByteCheck=0

0: disable
1: enable

6.3.13 WscVersion

Description: Set WPS support version
Value:

iwpriv ra0 set WscVersion=10

0x10: Hexadecimal

6.3.14 WscVersion2

Description: Set WPS version of V2 support
Value:

iwpriv ra0 set WscVersion2=20

0x20: Hexadecimal

6.3.15 WscV2Support

Description: Enable or disable WPS V2.0 support
Value:

iwpriv ra0 WscV2Support=1

0: disable
1: enable

6.3.16 WscFragment

Description: Enable or disable WPS fragmentation
Value:

iwpriv ra0 WscFragment=0

0: disable
1: enable

6.3.17 WscFragmentSize

Description: Configure the size of WPS fragmentation

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.
MEDIATEK CONFIDENTIAL
FOR wang.xiansheng@utt.com.cn USE ONLY

Value:

iwpriv ra0 set WscFragmentSize=128

128~300

6.3.18 WscSetupLock

Description: Enable or disable WPS setup lock
Value:

iwpriv ra0 set WscSetupLock=1

0: disable
1: enable

6.3.19 WscSetupLockTime

Description: Configure WPS setup lock time
Value:

iwpriv ra0 set WscSetupLockTime=0

0: lock forever
Unit: minute

6.3.20 WscMaxPinAttack

Description: Configure WPS PIN attack MAX time
Value:

iwpirv ra0 set WscMaxPinAttack=10

0: disable
1-10

6.3.21 WscExtraTlvTag

Description: Add extra TLV tag to Beacon, probe response and WSC EAP messages
Value:

iwpriv ra0 set WscExtraTlvTag=1088

Hex value: 0000 ~ FFFF
Example: 1088

6.3.22 WscExtraTlvType

Description: Define data format of extra TLV value
Value:

iwpriv ra0 set WscExtraTlvType=1

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.
MEDIATEK CONFIDENTIAL
FOR wang.xiasheng@utt.com.cn USE ONLY

0: ASCII string
1: Hex string

6.3.23 WscExtraTlvData

Description: Add extra TLV data to Beacon, probe response and WSC EAP messages
Value:

iwpriv ra0 set WscExtraTlvData=

ASCII string or Hex string

6.4 WPS Scenario

The following scenarios are currently supported:

- Initial WLAN Setup
  - Standalone AP with a built-in Registrar
  - AP with an external Registrar
    - EAP-based setup of External Wireless Registrar
      - [AP] --- EAP --- [Wireless Registrar]
    - UPnP-based setup of External Wired Registrar
      - [AP] --- UPnP --- [Wired Registrar]

- Adding Member Devices
  - In-band setup using a standalone AP/Registrar
    - [Enrollee] --- EAP --- [AP/Registrar]
  - In-band setup using an External Wired Registrar
    - [Enrollee] --- EAP --- [AP] --- UPnP --- [Wired Registrar]

6.4.1 Running WPS

First, run UPnP deamon.
wscd -w /etc/xml -m 1 -d 3 & (if your xml file in /etc/xml)

Note: wscd must be ported to the target platform first

You may use iwpriv command sequence to trigger WPS as below.

- iwpriv ra0 set WscConfMode=7
- iwpriv ra0 set WscConfStatus=1
- iwpriv ra0 set WscMode=1
- iwpriv ra0 set WscPinCode=31668576
- iwpriv ra0 set WscGetConf=1
- iwpriv ra0 set WscStatus=0

1. AP services as Enrollee:

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.
MEDIATEK CONFIDENTIAL
FOR wang.xiansheng@utt.com.cn USE ONLY

1.1. If AP-Enrollee SC state is 0x1, AP will restart with new configurations.
1.2. If AP-Enrollee SC state is 0x2, AP sends own configurations to external-registrar and ignores configurations from external-registrar.

2. AP services as Registrar:
   2.1. If AP-Registrar SC state is 0x1, the security mode will be WPAPSK/TKIP and generate random 64bytes psk; after process, AP will restart with new security.

3. WPS AP only services one WPS client at a time.
   3.1. WPS AP only can work in ra0.
   3.2. After WPS configuration finishes, driver writes new configuration to Cfg structure and DAT file.

4. Write items to MBSSID Cfg structure are as below:
   4.1. Ssid
   4.2. AuthMode
   4.3. WepStatus
   4.4. PMK
   4.5. DefaultKeyId.

5. Write items to SharedKey table are as below:
   5.1. Key
   5.2. CipherAlg

6. Write items to DAT file are as belw:
   6.1. SSID
   6.2. AuthMode
   6.3. EncrypType
   6.4. WPAPSK
   6.5. WscConfStatus
   6.6. DefaultKeyID

6.4.2 Initial WLAN setup with External Registrar

[Unconfigured AP] ← EAP → [Wireless Registrar]
[Unconfigured AP] ← UPnP → [Wired Registrar]

Please make sure that UPnP deamon has been running. After WPS registration succeeds, the configured AP will work as a proxy forwarding EAP and UPnP messages.

- PIN
  - AP configuration (as an Enrollee)
    - iwpriv ra0 set WscConfMode=7
    - iwpriv ra0 set WscConfStatus=1
    - iwpriv ra0 set WscMode=1
    - iwpriv ra0 set WscGenPinCode=1
    - iwpriv ra0 set WscGetConf=1
- PBC
  - AP configuration (as an Enrollee)
    - iwpriv ra0 set WscConfMode=7
    - iwpriv ra0 set WscConfStatus=1
    - iwpriv ra0 set WscMode=2
    - iwpriv ra0 set WscGetConf=1

FOR wangxianshong@utt.com.cn USE ONLY MEDIATEK CONFIDENTIAL

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.

6.4.3 Adding a member device using a standalone AP/Registrar

[STA] ← EAP → [AP/Registrar]

- PIN
  - AP configuration (as an Registrar)
    - iwpriv ra0 set WscConfMode=7
    - iwpriv ra0 set WscPinCode=xxxxxxxx (xxxxxxxx is Enrollee's PIN code)
    - iwpriv ra0 set WscMode=1
    - iwpriv ra0 set WscGetConf=1
- PBC
  - AP configuration (as an Registrar)
    - iwpriv ra0 set WscConfMode=7
    - iwpriv ra0 set WscMode=2
    - iwpriv ra0 set WscGetConf=1

6.4.4 Adding a member device using an External Wired Registrar

[STA] ← EAP → [AP] ← UPnP → [Registrar]

- PIN
  - on Registrar side
    - When prompted for the enrollee's PIN, Enter the enrollee's PIN.
    - AP Nothing to be selected.
    - The registration process will begin, and the application will display the result of the process on completion.
  - on Client (Enrollee) side
    - Select PIN process
    - The process will start, and the application will display the result of the process on completion
- PBC
  - on Registrar side
    - Select "push-button".
    - AP Nothing to be selected.
    - The registration process will begin, and the application will display the result of the process on completion.
  - on Client (Enrollee) side
    - Select PBC process
    - The registration process will start, and the application will display the result of the process on completion.

6.4.5 WPS Configuration Status

The WPS attribute "Simple Configuration (SC) State" in WPS IEs (contained in beacon and probe response) indicates whether a device is configured. If an AP is shipped from the factory in an un-configured state (SC State is 0x01), then the AP must change to the configured state (SC State is 0x02) if any of the following occurs.

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.
MEDIATEK CONFIDENTIAL
FOR wangyanshen@utt.com.cn USE ONLY

1. Configuration by an external registrar

The AP sends the WSC_Done message in the External Registrar configuration process.

2. Automatic configuration by internal registrar

The AP receives the WSC_Done response in the Enrollee Registration Process from the first Enrollee.
The internal registrar waits until successful completion of the protocol before applying the automatically generated credentials to avoid an accidental transition from unconfigured to configured in the case that a neighbouring device tries to run WSC before the real enrollee, but fails. A failed attempt does not change the configuration of the AP, nor the Simple Config State.

3. Manual configuration by user

A user manually configures the AP using whatever interface(s) it provides to modify any one of the following:

- the SSID
- the encryption algorithm
- the authentication algorithm
- any key or pass phrase

If an AP is shipped from the factory in an un-configured state (SC State 0x01), then a factory reset must revert the Simple Config State to un-configured. If an AP is shipped from the factory pre-configured with WPA2-Personal mixed mode and a randomly generated key, the SC State must be set to 'configured' (0x02) to prevent an external registrar from overwriting the factory settings. A factory reset must restore the unit to the same configuration as what it was when shipped.

6.5 Basic operation of Ralink WPS AP

6.5.1 Add member devices using a external Registrar in PIN mode

1. [Ralink AP] - Turn on APUT.
2. [Ralink STA] - Push PBC button.
3. [Microsoft STA] - Search will be configure enrollee (you can in control->network and internet->network and sharing center->add a device to the network). Enter the enrollee's PIN (Ralink STA) at Microsoft STA when prompted.
4. [Ralink AP] - Do nothing.
5. [Ralink STA] - Verify that Ralink STA successes to ping Ralink A.

6.5.2 Configure APUT using a wireless external Registrar in PIN mode

1. [Ralink AP] - Turn on Ralink AP
2. [Ralink AP] - Change AP ability "iwpriv ra0 set WscConfMode=7"
3. [Ralink AP] - Change from configured to un-configured state: "iwpriv ra0 set WscConfStatus=1 "
4. [Ralink AP] - Change config method to PIN "iwpriv ra0 set WscMode=1"
5. [Ralink AP] - Trigger Ralink AP start process WPS protocol "iwpriv ra0 set WscGetConf=1"
6. [Intel WPS STA] - The Registrar on Intel STA will be configured with the new parameters (SSID = "scaptest4.1.2ssid" and WPA(2)-PSK="scaptest4.1.2psk") which should be entered when prompted
7. [Intel WPS STA] - Read AP's PIN code from console and enter it at Intel STA.
8. [Intel WPS STA] - Verify that Intel STA successes to ping to Ralink AP
9. [Ralink STA] - Manually configure Ralink STA with the new parameters (SSID = "scaptest4.1.2ssid" and WPA (2)-PSK = "scaptest4.1.2psk").
10. [Intel WPS STA] - Verify that Intel STA successes to ping to Ralink STA

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.
MEDIATEK CONFIDENTIAL
FOR wansheng@ut.com.cn USE ONLY

6.5.3 Configure APUT using a wired external Registrar in PIN mode

1. [Ralink AP] - Turn on the Ralink AP
2. [Ralink AP] - Connect the Ethernet cable between AP and external Registrar (Windows Vista) and make sure you can ping AP from external Registrar first!
3. [Ralink AP] - Change AP ability “iwpriv ra0 set WscConfMode=7”
4. [Ralink AP] - Change from configured to un-configured state: “iwpriv ra0 set WscConfStatus=1 “
5. [Ralink AP] - Change config method to PIN “iwpriv ra0 set WscMode=1”
6. [Ralink AP] - Trigger Ralink AP start process WPS protocol “iwpriv ra0 set WscGetConf=1”
7. [Microsoft STA] - The Registrar on Microsoft STA will be configured with the new parameters (SSID = “scaptest4.1.3ssid” and WPA (2)-PSK=”scaptest4.1.3psk”) which should be entered when prompted
8. [Microsoft STA] - Read AP's PIN code from console and enter it at Microsoft STA
9. [Ralink STA] - Manually configure Ralink STA with the new parameters (SSID = “scaptest4.1.3ssid” and WPA (2)-PSK passphrase= “scaptest4.1.3psk”).
10. [Ralink STA] - Verify that Ralink STA successes to ping to Microsoft STA.

As to details of step-7, please refer to the following figures from [7-1] to [7-6].

6.5.4 How to know WPS AP services as Internal Registrar, Enrollee or Proxy

It depends on the content of EAP-Response/Identity from WPS Client.

- ⇨ When identity is "WFA-SimpleConfig-Registrar-1-0":
  WPS AP would service as Enrollee. (After set trigger command)
- ⇨ When identity is "WFA-SimpleConfig-Enrollee-1-0":
  WPS AP would service as Internal Registrar and Proxy.
  Without trigger command, WPS AP services as proxy only.

6.5.5 How to know WPS AP PinCode

Use ioctl query **RT_OID_WSC_PIN_CODE** OID to get AP PinCode.

6.5.6 Notes for WPS

1. AP services as Enrollee:
   1.1. If AP-Enrollee SC state is 0x1, AP's configuration is changeable and will restart with new configurations.
   1.2. If AP-Enrollee SC state is 0x2, AP's configuration is un-changeable. AP sends own configurations to external-registrar and ignores configurations from external-registrar.
2. AP services as Registrar:
   2.1. If AP-Registrar SC state is 0x1, the security mode will be WPAPSK/TKIP and generate random 64bytes psk; after process, AP will restart with new security.
3. AP services as Proxy:
   3.1. The value of SC state has no effect in proxy mode.
   3.2. WPS AP only services one WPS client at a time.
   3.3. WPS AP only can work in ra0.

6.6 UPnP Daemon HOWTO

6.6.1 Requirements:

1. Linux platform
2. Ralink wireless driver version which support WPS
3. The UPnP library (libupnp)
   - ⇨ You can download the libupnp source code from the following URL.
     http://upnp.sourceforge.net/
   - ⇨ libupnp-1.3.1 is the preferred version.
     For other versions, you may need to patch our modification to the library by yourself.
4. POSIX thread library
   - ⇨ Both libupnp and our WPS UPnP daemon need the POSIX thread library, following are recommended pthread library version.
     - For uCLibc, need the version >= 0.9.27
     - For GLIBC, need the version >= 2.3.2
   - ⇨ If your pthread library is older than upper list, you may need to upgrade it.

6.6.2 Build and Run:

1. Modify the "$(work_directory)/wsc_upnp/Makefile" and change the compile flags depends on your target platform.
   - ⇨ Ex. For arm-Linux target platform, you may need to set the following fags:
     - CROSS_COMPILE = arm-Linux-
     - TARGET_HOST = arm-Linux
     - **WIRELESS_H_INCLUDE_PATH = /usr/src/kernels/2.6.11-1.1369_FC4-smp-i686/include/**
2. Modify the "$(work_directory)/wsc_upnp/libupnp-1.3.1/Makefile.src" and change the configure parameters.
   - ⇨ Ex. For big-endian system, you may need to add CFAGS as following:
     - ./configure --host=$(TARGET_HOST) CFLAGS="-mbig-endian"
3. Compile it
   - ⇨ Run "make" in "$(work_directory)/wsc_upnp", after successful compilation, you will get an execution file named "wscd".
4. Install
   - ⇨ Create a sub-directory named "xml" in the "/etc" of your target platform
   - ⇨ Copy all files inside in "$(work_directory)/wsc_upnp/xml" to "/etc/xml"
     - Copy the "wscd" to the target platform.
5. Run it
   - ⇨ Before run it, be sure the target platform already **has set the default route or has a route entry for subnet 239.0.0.0 (For UuPnP Multicast)**. Or the WPS daemon will failed when do initialization.
   - ⇨ Now you can run it by following command:
     - /bin/wscd –m 1 –d 3

7 WMM

7.1 Introduction

IEEE 802.11e amendment is to provide basic QoS features to 802.11 network and Wi-Fi Multimedia (WMM) is a WFA interoperability certification based on the IEEE 802.11e standard. WMM prioritizes wireless traffic according to four Access Categories, including Voice (VO), Video (VI), Best Effort (BE) and Background (BK).

7.2 WMM iwpriv command

7.2.1 WmmCapable

Description: Enable or disable WMM QoS function
Value:

iwpriv ra0 set WmmCapable=1

0: disable
1: enable

7.3 Parameters in RT2860AP.dat

7.3.1 WmmCapable

Description: Enable or disable WMM QoS function
Value:

WmmCapable=1

0: disable
1: enable

Note: Only WmmCapable has iwpriv command support

7.3.2 APSDCapable

Description: WMM Automatic Power Save Delivery (APSD) function configuration
Value:

APSDCapable=0

0: disable
1: enable

MEDIATEK CONFIDENTIAL

7.3.3 APAifsn

Description: AP arbitration interframe space number configuration
Value:

APAifsn=3;7;1;1

AC_BE;AC_BK;AC_VI;AC_VO

7.3.4 APCwmin

Description: AP contention window minimum (exponent) configuration
Value:

APCwmin=4;4;3;2

AC_BE;AC_BK;AC_VI;AC_VO

7.3.5 APCwmax

Description: AP contention window maximum (exponent) configuration
Value:

APCwmax=6;10;4;3

AC_BE;AC_BK;AC_VI;AC_VO

7.3.6 APTxop

Description: AP Transmit Opportunity configuration (unit: 32μs)
Value:

APTxop=0;0;94;47

AC_BE;AC_BK;AC_VI;AC_VO

7.3.7 APACM

Description: AP Admission Control Mandatory configuration
Value:

APACM=0;0;0;0

AC_BE;AC_BK;AC_VI;AC_VO

7.3.8 BSSAifsn

Description: STA arbitration interframe space number configuration
Value:

BSSAifsn=3;7;2;2

8 IEEE802.11h

8.1 TPC

We do not support Transmission Power Control (TPC) and we provide a more flexible feature named Single SKU for fulfillment of the similar request.

8.2 DFS

Spectrum and Transmit Power Management

1. To turn on IEEE802.11h, just fill up the parameters of 'IEEE80211H', 'AutoChannelSelect' as 1, WirelessMode set as 3 to support A band. This parameter can work in only A band.
2. Use 'CSPeriod' to determine how many beacons before channel switch
3. Driver will turn off BBP tuning temporarily in radar detection mode
4. If turn on IEEE802.11h, AP will have 60sec to do channel available check, and will not send beacon and can not be connect.
5. Wi-Fi test requirement for IEEE802.11h
   - Force AP switch channel, AP will stop beacon transmit between 15 sec
   - At least five beacon includes channel switch announcement IE (37)in beacon frame
6. ETSI test requirement, please refer to ETSI EN 301 893 for V1.2.3 detail

Table D.1: DFS requirement values

Parameter	Value
Channel Availability Check Time	60 s
Channel Move Time	10 s
Channel Closing Transmission Time	260 ms

Table D.2: Interference Threshold values, Master

Maximum Transmit Power	Value (see note)
≥ 200 mW	-64 dBm
< 200 mW	-62 dBm
NOTE: This is the level at the input of the receiver assuming a 0 dBi receive antenna.	

Table D.3: Interference Threshold values, Slave

Maximum Transmit Power	Value (see note)
≥ 200 mW	-64 dBm
< 200 mW	N/A
NOTE: This is the level at the input of the receiver assuming a 0 dBi receive antenna.	

8.3 Parameters in RT2860AP.dat

8.3.1 IEEE80211H

Description: Enable or disable IEEE 802.11h support (DFS)
Value:

IEEE80211H=0

© 2015 MediaTek Inc.

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.

MEDIATEK CONFIDENTIAL
FOR wang.xinsheng@ utc.com.cn USE ONLY

0: disable
1: enable

8.3.2 DfsEnable

Description: Enable or disable DFS
Value:

DfsEnable=1

0: disable
1: enable

Note: MT7615 Only

MT7615 need to turn on IEEE80211H=1 and DfsEnable=1 to support DFS

8.3.3 CSPeriod

Description: Configure how many Beacon (with Channel Switch Announcement IE) will be sent before changing to a new channel
Value:

CSPeriod=10

0 ~ 255

Note:
CS stands for Channel Switch and it default value is 10. Unit is Beacon count.
MT7615 default value is 5.

8.4 DFS iwpriv command

8.4.1 IEEE80211H

Description: Enable or disable IEEE 802.11h support (DFS)
Value:

IEEE80211H=0

0: disable
1: enable

8.5 DFS Test example

Case 1: Band 2 & 3 select one channel for test
Test Condition:
Run 30% throughput between STA and AP.

DFS Debug command:
iwpriv ra0 set RadarDebug=0x10

DFS CE certification setting in the profile:

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.
FOR MEDIATEK CONFIDENTIAL
wang.xiansheng@utt.com.cn USE ONLY

IEEE80211H=1
DfsOutdoor=0
RDRegion=CE
CountryCode=GB

Result:
All major test items are all passed.

Case 2: Band 2 & 3 select one channel for test.
Test condition:
Run video stream throughput between STA and AP. (Set AP Fix Tx Rate to MCS0)
Bandwidth setting 20MHz and 20/40MHz Auto.

DFS Debug command:
iwpriv ra0 set RadarDebug=0x10

DFS FCC certification setting in the profile:
IEEE80211H=1
DfsOutdoor=0
RDRegion=FCC
CountryCode=US

Result:
When Radar signal run in 5498~5502MHz, Radar type 3 & 4 fail in BW 40MHz test.
Radar type 1 fail in BW 20MHz test, Recommend to make the Radar signal run in 5495~5525MHz with BW 40MHz test. In 5494~5506MHz in BW 20MHz test. All major test items are all passed.

Case 3: Detect DFS signal without move channel. (For Lab testing)
Command Example:

iwpriv ra0 set Debug=3
iwpriv ra0 set Channel=100
iwpriv ra0 set RadarDebug=0x10
iwpriv ra0 set ChMovTime=2
iwpriv ra0 set DfsSwDisable=0

Result:
When Radar signals run in channl 100, the AP will display DFS detected information on the console.

DFS deteched consloe log may look like below:

DFS HW check channel = 0x4
T= XXXXX W= XXX detected by ch 2

Note: MT7615 not support

10 Authenticator

IEEE Std. 802.1X-2001 is a standard for port-based network access control. It introduces an extensible mechanism for authenticating and authorizing users. There are 3 major components which includes **Supplicant**, **Authenticator** and **Authentication Server** (AS).

The following material is from http://tldp.org/HOWTO/html_single/8021X-HOWTO/.

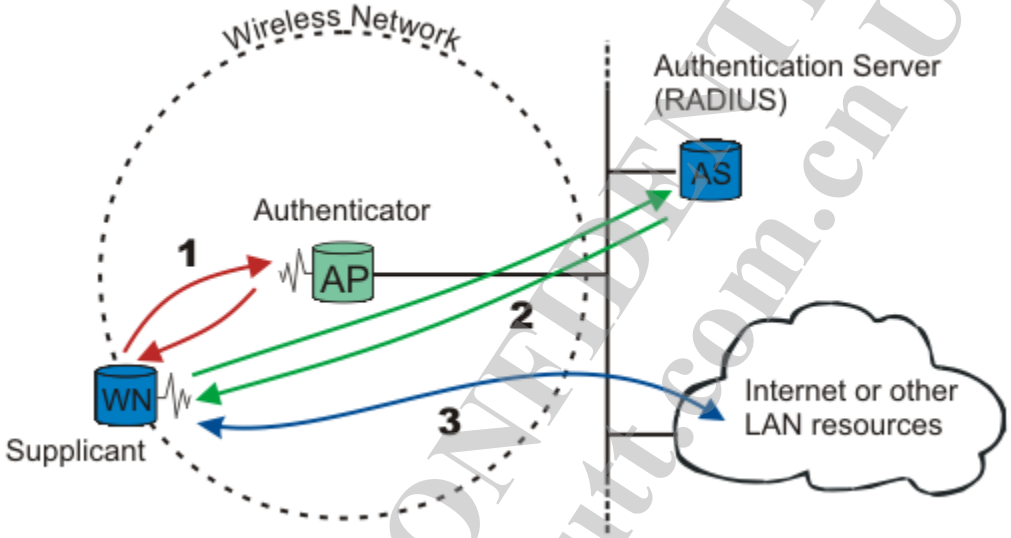

Figure: *A wireless node must be authenticated before it can gain access to other LAN resources.*

When a new wireless node (WN) requests access to a LAN resource, the access point (AP) asks for the WN's identity. No other traffic than EAP is allowed before the WN is authenticated.

The wireless node that requests authentication is often called **Supplicant**, although it is more correct to say that the wireless node contains a Supplicant. The Supplicant is responsible for responding to Authenticator data that will establish its credentials. The same goes for the access point; the access point contains an **Authenticator**. The Authenticator does not even need to be in the access point; it can be an external component.

After the identity has been sent, the authentication process begins.The protocol used between the Supplicant and the Authenticator is EAP, or more correctly, EAP encapsulation over LAN (**EAPoL**). The **Authenticator** re-encapsulates the EAP messages to Radius format, and passes them to the **Authentication Server**.

During authentication, the **Authenticator** just relays packets between the **Supplicant** and the **Authentication Server**. When the authentication process finishes, the Authentication Server sends a success message (or failure message if the authentication failed). The Authenticator then opens the "port" for the Supplicant. After a successful authentication, the Supplicant is granted access to other LAN resources or Internet.

10.1 Parameters in RT2860AP.dat

10.1.1 IEEE8021X

Description: Enable or disable 802.1X-WEP/802.1X-NONE mode
Value:

IEEE8021X=0

0: disable
1: enable

Note: It is enabled only when using Radius-WEP or Radius-NONE.

10.1.2 RADIUS_Server

Description: RADIUS server IP address configuration
Value:

RADIUS_Server=10.10.10.253

Note: IPv4 only

10.1.3 RADIUS_Port

Description: RADIUS server port number configuration
Value:

RADIUS_Port=1812

10.1.4 RADIUS_Key

Description: RADIUS key configuration
Value:

RADIUS_Key=password

10.1.5 own_ip_addr

Descripion: Configure SoftAP its own IP address
Value:

own_ip_addr=10.10.10.254

10.1.6 session_timeout_interval

Descripion: Configure the timeout interval for re-authentication
Value:

session_timeout_interval=120 (unit: second)

Note:

© 2015 MediaTek Inc.

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.

FOR wang.xiansheng@utt.com.cn USE ONLY
MEDIATEK CONFIDENTIAL

0: Disable re-authentication service
It must be larger than 60. Every session would be re-authenticated for a regular interval defined by this parameter.

10.1.7 PMKCachePeriod

Description: PMK Cache period configuration
Value:

PMKCachePeriod=10 (unit: minutes)

Note:

Default is 10 minutes.

10.1.8 EAPifname

Description: EAPifname is assigned as the binding interface for EAP negotiation
Value:

EAPifname=

Example:

EAPifname=br0

Note:

Its default value is "br0". However, if the wireless interface is not attached to the bridge interface or the name of the bridge interface is not "br0", please modify it.

10.1.9 PreAuth

Description: Enable or disable **WPA2** pre-authentication mode
Value:

PreAuth=0

0: disable
1: enable

10.1.10 PreAuthifname

Description: PreAuthifname is assigned as the binding interface for **WPA2** pre-authentication
Value:

PreAuthifname=

Example:

PreAuthifname=br0

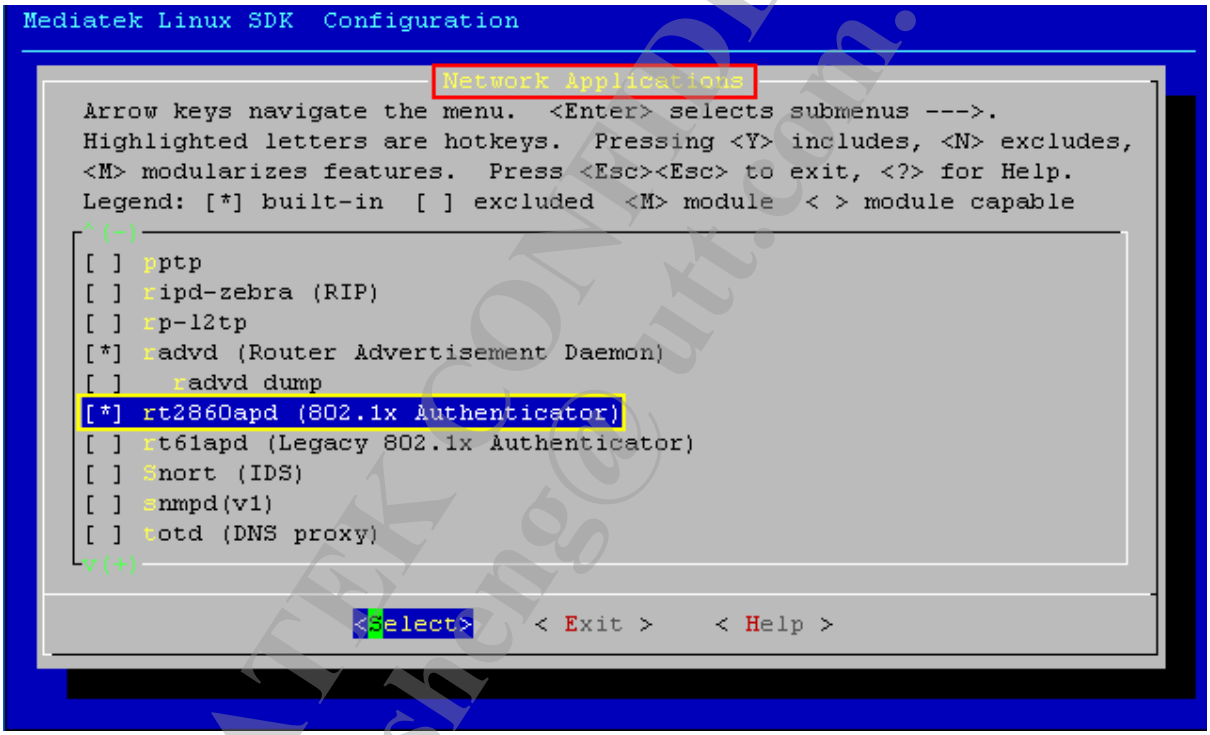
10.2 rt2860apd

rt2860apd - IEEE 802.1X Authenticator (user space utility)
Source folder in reference SDK: **RT288x_SDK/source/user/802.1x**
Binary location in reference image: **/bin/rt2860apd**

rt2860apd implements part of IEEE 802.1X which helps the Authentication Server (AS) authorizing the Supplicant and also prove itself a valid Authenticator to AS. Please be noted that rt2860apd does not include the state machine for Key Management. Instead, the Key Management function is included in the wireless driver. Actually, rt2860apd relays EAP frames between the Supplicant and the AS. The port control entity is also implemented in the wireless driver.

10.2.1 How to turn on rt2860apd



10.2.2 How to configure rt2860apd

When rt2860apd starts, it will read settings from the driver profile (RT2860AP.dat). For any changes to make, you need to edit the configuration file, and then restart both the wireless interface and rt2860apd. Actually, the command “iwpriv ra0 set SSID=XXXX” would do the job.

The following four parameters in the configuration file are mandatory for rt2860apd. You should configure them correctly according to your own setup.

- RADIUS_Server='10.10.10.253'
- RADIUS_Port='1812'
- RADIUS_Key='password'
- own_ip_addr='10.10.10.254'

10.3 Multiple RADIUS Servers Support

As to MBSSID, you can use ";" to separate the settings for each BSSID. Example is as follows.

RADIUS_Server=192.168.2.1;192.168.2.2;192.168.2.3;192.168.2.4
RADIUS_Port=1811;1812;1813;1814
RADIUS_Key=ralink_1;ralink_2;ralink_3;ralink_4

This implies,
The RADIUS server IP for ra0 is 192.168.2.1, its port is 1811 and its secret key is ralink_1.
The RADIUS server IP for ra1 is 192.168.2.2, its port is 1812 and its secret key is ralink_2.
The RADIUS server IP for ra2 is 192.168.2.3, its port is 1813 and its secret key is ralink_3.
The RADIUS server IP for ra3 is 192.168.2.4, its port is 1814 and its secret key is ralink_4.

Also, we have **Failover** mechanism and it means you can have a backup Radius server for each BSSID. Example is as follows. Both of them are written in the same profile.

<Default>
RADIUS_Server=192.168.2.1;192.168.2.2;192.168.2.3;192.168.2.4
RADIUS_Port=1811;1812;1813;1814
RADIUS_Key=ralink_1;ralink_2;ralink_3;ralink_4

<Failover>
RADIUS_Server=10.10.10.1; 10.10.10.2; 10.10.10.3; 10.10.10.4
RADIUS_Port=1812;1812;1812;1812
RADIUS_Key=ralink_5;ralink_6;ralink_7;ralink_8

You may use iwpriv command to do the same thing for each BSSID.
iwpriv ra0 set RADIUS_Server="192.168.1.1;192.168.1.2"
iwpriv ra0 set RADIUS_Port="1812;1813"
iwpriv ra0 set RADIUS_Key="mediatek123;mediatek456"

For backward compatibility, "RADIUS_Key" and "RADIUS_Key%d" are both accepted by the driver for key configuration. You may use either one of them but the paramter "RADIUS_Key" has higher priority.

<Default>
RADIUS_Key1=ralink_1 // ra0
RADIUS_Key2=ralink_2 // ra1
RADIUS_Key3=ralink_3 // ra2
RADIUS_Key4=ralink_4 // ra3

<Failover>
RADIUS_Key1=ralink_5
RADIUS_Key2=ralink_6
RADIUS_Key3=ralink_7
RADIUS_Key4=ralink_8

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.
MEDIATEK CONFIDENTIAL
FOR wang.xiansheng@utt.com.cn USE ONLY

10.4 Enhanced Dynamic WEP Keying

In **Radius-WEP**, the authentication process also generates keys for both broadcast and unicast. The unicast key is unique for every individual client so it is always generated randomly by 802.1X daemon. However, the broadcast key is shared among all associated clients and it can be manually configured by User or still generated randomly by 802.1X daemon just like the unicast key does.

802.1X daemon would use the following parameters in RT2860AP.dat as material to “manually” generate the broadcast key.

- DefaultKeyID
- Key0Type, Key1Type, Key2Type, Key3Type
- Key0Str, Key1Str, Key2Str, Key3Str

The 802.1X daemon needs to read RT2860AP.dat to decide whether the broadcast key is generated randomly or not, but if the Key%dStr is empty or incorrectly configured, the broadcast key would be generated randomly by 802.1X daemon instead.

10.5 Examples

In the following examples, we all assume that DUT has IP address 192.168.1.138 and the Authentication Server has IP address 192.168.1.1. Also, we assume that Radius secret is “myownkey”.

10.5.1 Radius-None

RADIUS_Server=192.168.1.1
RADIUS_Port=1812
RADIUS_Key=myownkey
own_ip_addr=192.168.1.138
AuthMode=OPEN
EncrypType=NONE
IEEE8021X=1

10.5.2 Radius-WEP

RADIUS_Server=192.168.1.1
RADIUS_Port=1812
RADIUS_Key=myownkey
own_ip_addr=192.168.1.138
AuthMode=OPEN
EncrypType=WEP
IEEE8021X=1

10.5.3 WPA-TKIP

RADIUS_Server=192.168.1.1
RADIUS_Port=1812

This document contains information that is proprietary to MediaTek Inc.

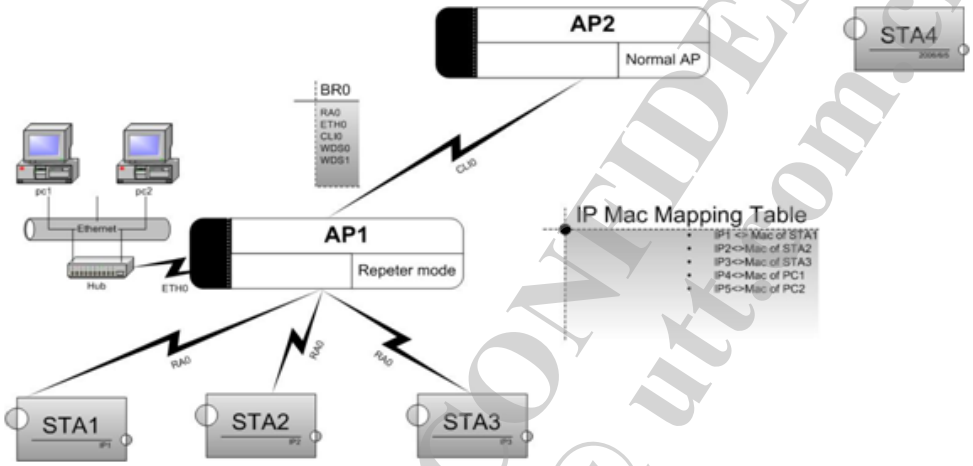
11 AP-CLIENT

The AP-Client function provides a simulated and virtual STA interface while the original AP interface is working simultaneously. Its application is usually a wireless repeater or a wireless extender. AP-Client mainly provides a 1-to-N MAC address mapping mechanism such that multiple stations connected to the AP can transparently communicate with another AP, which we usually call RootAP. When AP-Client function is enabled, besides the original AP interface named ra0, a virtual interface named apcli0 will be created. In a repeater application, the software bridge, like br0, is used to relay packets between these two interfaces.The following figure shows the common network topology and operation module of our AP-Client function.



AP1 is an Access Point which enabled AP-Client and therefore has two wireless interfaces, ra0 and apcli0, providing the AP and station function respectively. AP2 is just a tranditional Access Point that provides normal AP function. In the figure, you can see that STA1 associated to AP1 and STA4 associated to AP2. In the old days, if STA1 wants to communicate with STA4, AP1 and AP2 must have some kind of connection between them to relay traffic, like Ethernet LAN (wired) or WDS (wireless). Now with the new AP-Client feature, AP1 can use the simulated STA interface apcli0 to connect to AP2, thus creating the link, and then STA1 can communicate with STA4 transparently and wired stations connected to AP1 through Ethernet could also communicate with STA4.

Here are some reminders for you before using AP-Client.

- AP-Client only supports the following protocols due to the limitation of 1-to-N MAC address mapping mechanism
  - All IP-based network applications
  - ARP
  - DHCP
  - PPPoE
- The last hexadecimal number of the MAC address must be a multiple of 2

11.1 How to Setup AP-Client

- Turn on **APCLI_SUPPORT** in driver config
- Use "**ifconfig apcli0 up**" to bring up your AP-Client interface

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.
MEDIATEK CONFIDENTIAL
FOR wang.xiaofeng@ utt.com.cn USE ONLY

- In a repeater application, you may use the following commands to bridge ra0 and apcli0
  - **brctl addif br0 ra0**
  - **brctl addif br0 apcli0**
- The security policy support for AP-Client include
  - OPEN
  - SHARED (WEP)
  - WPAPSK (TKIP, AES)
  - WPA2PSK (TKIP, AES)
- Please be noted that AP-Client is also a virtual interface. When you use AP-Client with MBSSID simultaneously, AP-Client will consume one position and the parameter “BssidNum” should be larger than 1 and less than 7 (1 < BssidNum < 7)
- Use “**iwpriv apcli0 show connStatus**” to display connection status with RootAP

11.2 Parameters in RT2860AP.dat

11.2.1 ApCliEnable

Description: Enable or disable AP-Client function
Value:

ApCliEnable=1

0: disable
1: enable

11.2.2 ApCliSsid

Description: Configure the target/RootAP SSID which AP-Client wants to connect with
Value:

ApCliSsid=target_ssid

target_ssid: 1~32 characters

11.2.3 ApCliBssid

Description: Configure the target BSSID which AP-Client wants to join
Value:

ApCliBssid=00:11:22:33:44:55

Note: It is an optional command. Users can use this command to indicate the desired BSSID. Otherwise, AP-Client would get correct BSSID according to configured SSID automatically.

11.2.4 ApCliAuthMode

Description: AP-Client authentication mode configuration
Value:

12 WDS

A Wireless Distribution System is a system enabling the wireless interconnection of acess points. Each WDS AP needs to be in the same channel, using the same encryption type.

Actually, there is no test plan to ensure the inter-operability of all WDS products from different Vendors. Mediatek's implementation provides two modes of AP-to-AP connectivity. One is **Bridge mode**, in which WDS APs communicate only with each other and do not allow wireless stations to access them. The other is **Repeater mode**, in which WDS APs communicate with each other and with wireless stations.

In case you want to have an auto-learning WDS peer, we also provide the **Lazy mode** in which you do not need to thoroughly configure the WDS settings. However, be noted that you cannot configure all APs to be in Lazy mode, otherwise no 4-address frame will be transmitted at all and auto-learning would be impossible. This means that there should be at least one AP being configured to Bridge mode or Repeater mode.

12.1 How to Steup WDS

1. Edit the driver profile in each WDS peer
   WDS Peer-A with the MAC address 00:0C:43:aa:bb:cc
   - WdsEnable=3
   - WdsPhyMode=HTMIX;
   - WdsList=00:0C:43:11:22:33;
   - WdsEncrypType=NONE;

   WDS Peer-B with the MAC address 00:0C:43:11:22:33
   - WdsEnable=3
   - WdsPhyMode=HTMIX;
   - WdsList=00:0C:43:aa:bb:cc;
   - WdsEncrypType=NONE;

2. Edit your networking script file, like bridge_setup.sh, according to the number of WDS link. Add "**brctl addif br0 wds0**" and "**ifconfig wds0 0.0.0.0**" to relative places

3. Use "**iwpriv ra0 show wdsinfo**" to display WDS link information

12.2 WDS Security

WDS security is **PSK-only**, and it does not support mixed mode, like WPAPSKWPA2PSK.

When WDS is in Lazy mode, all WDS links (wds0 ~ wds3) shall share the same encryption type and key material (referring to wds0 settings). Otherwise, each WDS link has its own security settings. No matter what WDS mode you use, it has nothing to do with the encryption of the main BSSID (ra0).

WdsKey:
It is used for all WDS interfaces and supports only AES and TKIP configuration. If you want to use WEP, key settings will be retrieved from the main BSSID.

MEDIATEK CONFIDENTIAL
FOR wang.xiansheng@utt.com.cn USE ONLY

Wds0Key/Wds1Key/Wds2Key/Wds3Key:
They are used to configure key settings for each WDS interface.

The following example is to create one WDS link (wds0) with AES encryption.
WdsEnable=3
WdsPhyMode=HTMIX;HTMIX;HTMIX;HTMIX
WdsList=00:0c:43:12:34:56;
WdsEncrypType=AES;NONE;NONE;NONE
Wds0Key=12345678
Wds1Key=
Wds2Key=
Wds3Key=

12.3 Parameters in RT2860AP.dat

12.3.1 WdsEnable

Description: WDS function configuration
Value:

WdsEnable=0

0: **Disable** - Disable WDS function.
1: Restrict mode - Same as Repeater mode.
2: **Bridge mode** - Enable WDS and work like a bridge.
The MAC address of peer WDS APs should be configured in the "WdsList" field.
In this mode, AP is just a bridge and will not send any beacon and will not respond to any probe request packet. Therefore STA will not be able to connect with it.
3: **Repeater mode** - Enable WDS and work like a repeater.
The MAC address of peer WDS APs should be configured in the "WdsList" field.
4: **Lazy mode** - Enable WDS function.
It automatically learns from 4-address format frames sent by the WDS peer and you do not have to configure WdsList manually.

12.3.2 WdsList

Description: WDS peer MAC address configuration
Value:

WdsList=00:10:20:30:40:50;

The maximum WDS link number is 4.
wds0;wds1;wds2;wds3

12.3.3 WdsEncrypType

Description: WDS encryption configuration
Value:

WdsEncrypType=NONE;

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.
MEDIATEK CONFIDENTIAL
FOR wang.xiansheng@utt.com.cn USE ONLY

The option includes NONE, WEP, TKIP and AES.

Example:

WdsEncrypType=OPEN;WEP;TKIP;AES

The encrptytion of wds0 is OPEN
The encrptytion of wds1 is WEP
The encrptytion of wds2 is TKIP
The encrptytion of wds3 is AES

12.3.4 WdsKey

Description: WDS key configuration

Value:

WdsKey=12345678

8 ~ 63 ASCII characters (eg: 12345678) for TKIP or AES
64 hexadecimal characters for TKIP or AES

WdsKey is kept for backward-compatibility and it only supports TKIP and AES.
You can use either WdsKey or Wds[0-4]Key but not both.

Note: Combinations of WDS security mode

EncrypType	WdsEncrypType	WdsEncrypType of the WDS peer	Note
NONE	NONE	NONE	
WEP	WEP	WEP	Using legacy key setting method
TKIP	TKIP	TKIP	WDS's key is from WdsKey
TKIP	AES	AES	WDS's key is from WdsKey
AES	TKIP	TKIP	WDS's key is from WdsKey
AES	AES	AES	WDS's key is from WdsKey
TKIPAES	TKIP	TKIP	WDS's key is from WdsKey
TKIPAES	AES	AES	WDS's key is from WdsKey

12.3.5 Wds0Key

Description: WDS key for Link-0

Value:

Wds0Key=12345678

10 or 26 hexadecimal characters (eg: 1234567890) for WEP
5 or 13 ASCII characters (eg: 12345) for WEP
8 ~ 63 ASCII characters (eg: 12345678) for TKIP or AES
64 hexadecimal characters for TKIP or AES

12.3.6 Wds1Key

Description: WDS key for Link-1

Value:

Wds1Key=12345678

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.

MEDIATEK CONFIDENTIAL
FOR wangxiansheng@utt.com.cn USE ONLY

10 or 26 hexadecimal characters (eg: 1234567890) for WEP
5 or 13 ASCII characters (eg: 12345) for WEP
8 ~ 63 ASCII characters (eg: 12345678) for TKIP or AES
64 hexadecimal characters for TKIP or AES

12.3.7 Wds2Key

Description: WDS key for Link-2
Value:

Wds2Key=12345678

10 or 26 hexadecimal characters (eg: 1234567890) for WEP
5 or 13 ASCII characters (eg: 12345) for WEP
8 ~ 63 ASCII characters (eg: 12345678) for TKIP or AES
64 hexadecimal characters for TKIP or AES

12.3.8 Wds3Key

Description: WDS key for Link-3
Value:

Wds3Key=12345678

10 or 26 hexadecimal characters (eg: 1234567890) for WEP
5 or 13 ASCII characters (eg: 12345) for WEP
8 ~ 63 ASCII characters (eg: 12345678) for TKIP or AES
64 hexadecimal characters for TKIP or AES

12.3.9 WdsPhyMode

Description: WDS link physical mode configuration
Value:

WdsPhyMode=HTMIX;

The option includes CCK, OFDM, HTMIX and GREENFIELD.

Example:

WdsPhyMode=CCK;OFDM;HTMIX;GREENFIELD

The PHY mode of wds0 is CCK
The PHY mode of wds1 is OFDM
The PHY mode of wds2 is HTMIX
The PHY mode of wds3 is GREENFIELD

13 IGMP SNOOPING

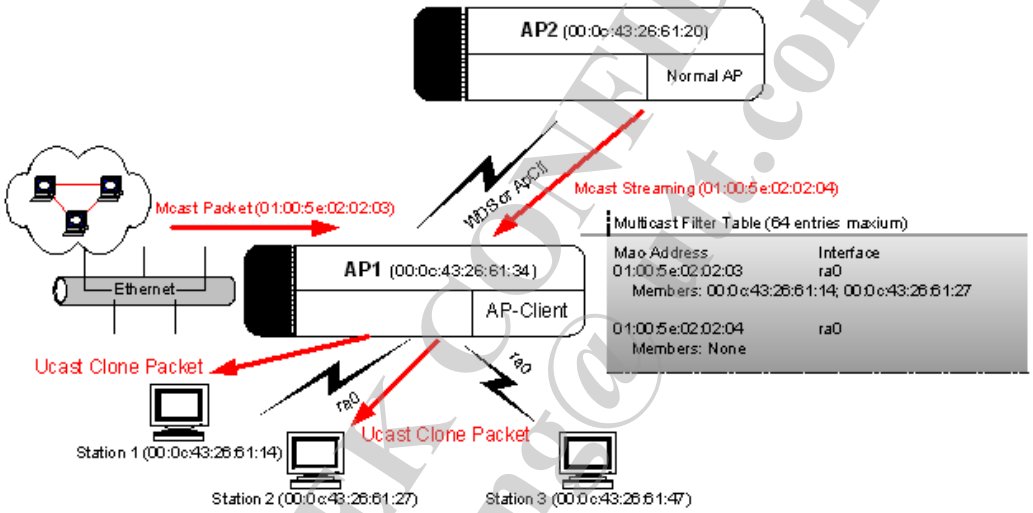
13.1 Basic

Please check the following two Wiki links.

- http://en.wikipedia.org/wiki/Multicast_address
- http://en.wikipedia.org/wiki/Internet_Group_Management_Protocol

IGMP Snooping provides a mechanism converting multicast traffic into unicast traffic. When AP receives incoming multicast traffic, the conversion would be done based on an IGMP Snooping table (Multicast Filter Table).

13.2 Introduction to IGMP Snooping Table



An IGMP Snooping table (a.k.a. Multicast Filter Table) entry consists of 3 components, Group-ID (Multicast MAC Address), Network-Interface and Member-List. Taking above figure for example, you can see that Multicast Filter Table of AP1 has two table entries. One is “01:00:5e:02:02:03” with two members on interface ra0 and the other is “01:00:5e:02:02:04” without any member on interface ra0.

In our implementation, AP will automatically maintain the Multicast Filter Table through packet snooping. The IGMP-Membership-Report packets sent from connected stations would be checked and parsed. You can also manually add and delete an entry through iwpriv command.

13.3 Multicast Packet Parsing Process

When AP receives multicast packets, it will check whether the multicast destination address matches any Group-ID in the Multicast Filter Table. AP will drop the packet if no match found. Otherwise, there are two cases how AP handles a multicast packet. The first one is that Member-List of the matching entry is empty and then AP just forwards multicast packets to all stations connected to the Network-

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.
MEDIATEK CONFIDENTIAL
FOR Yang.Xiaohen@mediatek.com.cn USE ONLY

Interface. In the second case, there are members in the Member-List and AP will do the MC-to-UC conversion based on the membership.

Taking the previous figure for example, AP1 received an Ethernet multicast packet with Group-ID being 01:00:5e:02:02:03. Firstly AP1 checked the Multicast Filter Table and found the first entry matched. Therefore, AP1 cloned every multicast packet into two unicast packets destined to Station 1 and Station 2 respectively.

In the same figure, a multicast streaming sent from AP2 to AP1 with Group-ID 01:00:5e:02:02:04 was forwarded to all stations connected to AP1 (ra0) since the matching entry had no member at all.

<Multicast Filter Table Example>

Group-ID	Network-Interface	Member-List
01:00:5e:02:02:03	ra0	00:0c:43:26:61:14 (Station 1) 00:0c:43:26:61:27 (Station 2)
01:00:5e:02:02:04	ra0	

13.4 Parameters in RT2860AP.dat

13.4.1 IgmpSnEnable

Description: Enable or disable IGMP Snooping function
Value:

IgmpSnEnable=1

0: disable
1: enable

Note: Please make sure that IGMP_SNOOP_SUPPORT is turned on in driver config

13.5 IGMP Snooping iwpriv command

13.5.1 IgmpSnEnable

Description: Enable or disable IGMP Snooping function
Value:

iwpriv ra0 set IgmpSnEnable=1

0: disable
1: enable

13.5.2 IgmpAdd

Description: Create a new group or add a new member to the existing group
Format:

// Create a new group <Group-ID> which can be a MAC address or an IP address

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.
MEDIATEK CONFIDENTIAL
FOR wang.xiansheng@utt.com.cn USE ONLY

iwpriv ra0 set IgmpAdd=<Group-ID>
// Add a new member to the existing group. [Member] can only be a MAC address
iwpriv ra0 set IgmpAdd=<Group-ID-[Member]-…>

Value:

// Create a new group via either IP or MAC address
iwpriv ra0 set IgmpAdd=**226.2.2.3**
iwpriv ra0 set IgmpAdd=**01:00:5e:02:02:03**

// Add a new member to the existing group
iwpriv ra0 set IgmpAdd=**226.2.2.3-00:0c:43:26:61:11**
// Add 2 new members to the existing group
iwpriv ra0 set IgmpAdd=**01:00:5e:02:02:03-00:0c:43:26:61:27-00:0c:43:26:61:28**

13.5.3 IgmpDel

Description: Delete a group or remove a member from the existing group
Format:

// Delete a group <Group-ID> which can be a MAC address or an IP address
iwpriv ra0 set IgmpDel=<Group-ID>
// Remove a member from the existing group. [Member] can only be a MAC address
iwpriv ra0 set IgmpDel=<Group-ID-[Member]-…>

Value:

// Delete a new group via either IP or MAC address
iwpriv ra0 set IgmpDel=**226.2.2.3**
iwpriv ra0 set IgmpDel=**01:00:5e:02:02:03**

// Remove a member from the existing group
iwpriv ra0 set IgmpDel=**226.2.2.3-00:0c:43:26:61:11**

// Remove members from the existing group
iwpriv ra0 set IgmpDel=**01:00:5e:02:02:03-00:0c:43:26:61:27-00:0c:43:26:61:28**

14 MAC Repeater

The MAC Repeater is a variation of the original AP-Client funcation and it acts as a wireless proxy for its clients. The repeater will create a corresponding upstream connection to the RootAP for each downstream client connected to it. An upstream connection is created according to its own wireless capability and security mode. When a client disconnects from the repeater, the repeater must also disconnect its corresponding upstream connection with the RootAP. All communication between downstream clients and upstream RootAP utilizes one “AP-Client” interface on the repeater.

For example, if there are 3 clients connected to the repeater, 3 upstream connections will be created accordingly. Besides these “proxy connection”, the repeater itself would also create a connection with RootAP. Therefore, in this case there would be totally 3 downstream and 4 upstream connections.

Please be noted that MAC Repeater has the following limitation.

- Roaming of STAs between different BSSs is not supported
- WPA2-Enterprise Security is not supported
- Supported protocols: IPv4 / ARP / DHCP
- The MAC Repeater supports up to 16 clients
- Impact CPU utilization due to parsing all received packets from the STA and all multicast and broadcast packets

14.1 MAC Repeater iwpriv command

14.1.1 MACRepeaterEn

Description: Enable or disable MAC Repeater function
Value:

iwpriv ra0 set MACRepeaterEn=1

0: disable
1: enable

14.1.2 Example

- **iwpriv ra0 set MACRepeaterEn=1**
- ifconfig apcli0 up
- brctl addif br0 apcli0
- iwpriv apcli0 set ApCliEnable=0
- iwpriv apcli0 set ApCliAuthMode=OPEN
- iwpriv apcli0 set ApCliEncrypType=NONE
- iwpriv apcli0 set ApCliSsid=RootAP_SSID
- iwpriv apcli0 set ApCliEnable=1

15 PMF

PMF stands for Protected Management Frame and IEEE 802.11w is the PMF standard. Its objective is to increase the security of 802.11 management frames.

Note: Currently supported chips are MT7602E, MT7612E, MT7603E, MT7628.

15.1 PMF iwpriv command

15.1.1 PMFMFPC

Description: Enable or disable Protection Management Frame Capable
Value:

iwpriv ra0 set PMFMFPC=1

0: disable
1: enable

15.1.2 PMFMFPR

Description: Enable or disable Protection Management Frame Required
Value:

iwpriv ra0 set PMFMFPR=1

0: disable
1: enable

15.1.3 PMFSHA256

Description: Enable or disable use SHA256 for Encryption
Value:

iwpriv ra0 set HtMcs=0 // Please check Note-11a
iwpriv ra0 set SSID=11A_only_AP // Restart AP

Note-11a:

HtMcs	0	1	2	3	4	5	6	7
Rate	6 Mbps	9 Mbps	12 Mbps	18 Mbps	24 Mbps	36 Mbps	48 Mbps	54 Mbps

17.3.2 N only

iwpriv ra0 set FixedTxMode=HT
iwpriv ra0 set WirelessMode=11 // 5g 11n only
iwpriv ra0 set BasicRate=336 // 6, 12, 24 Mbps
iwpriv ra0 set HtMcs=0
iwpriv ra0 set HtGi=0
iwpriv ra0 set HtBw=0
iwpriv ra0 set SSID=11AN_only_AP // Restart AP

Note-11n:
HtMcs=<0-15> + HtGi=<0-1> + HtBw=<0-1>
Please check all possible combination of above set in Section 21.1.

17.4 11ac

17.4.1 VHT Fixed Rate iwpriv command

17.4.1.1 fpga_on

Description: Turn on or off VHT fixed rate
Value:

iwpriv rai0 set fpga_on=6

0: Disable
6: Enable

17.4.1.2 dataphy

Description: PHY mode configuration
Value:

iwpriv rai0 set dataphy=4

0 = CCK
1 = OFDM
2 = HT-MM
3 = HT-GF
4 = VHT

This document contains information that is proprietary to MediaTek Inc.

MEDIATEK CONFIDENTIAL
FOR wangxiansheng@utt.com.cn USE ONLY

17.4.1.3 databw

Description: Bandwidth configuration
Value:

iwpriv rai0 set databw=2

0 = 20M
1 = 40M
2 = 80M

17.4.1.4 datamcs

Description: MCS configuration
Value:

iwpriv rai0 set datamcs=24

Note
bit[3:0] stands for Modulation Coding Scheme (MCS)

Range: 0 - 9

bit[6:4] stands for Number of Spatial Stream (NSS)

0: 1SS
1: 2SS

Example:
datamcs=24 → 2SS MCS8
24 (dec) = 0x18 = b'0001,1000
bit[6:4] = b'001 = 1 (dec) → 2SS
bit[3:0] = b'1000 = 8 (dec) → MCS8

1SS & 2SS MCS Rate mapping table:

1SS

MCS Index	Modulation	Value (Dec)
0	BPSK	0
1	QPSK	1
2	QPSK	2
3	16-QAM	3
4	16-QAM	4
5	64-QAM	5
6	64-QAM	6
7	64-QAM	7
8	256-QAM	8
9	256-QAM	9

2SS

MCS Index	Modulation	Value (Dec)
0	BPSK	16
1	QPSK	17
2	QPSK	18
3	16-QAM	19
4	16-QAM	20
5	64-QAM	21
6	64-QAM	22
7	64-QAM	23
8	256-QAM	24
9	256-QAM	25

17.4.1.5 datagi

Description: Guard Interval configuration

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.
FOR wang.xiansheng@utt.com.cn USE ONLY MEDIATEK CONFIDENTIAL

Value:

iwpriv rai0 set datagi=0

0 = Long GI
1 = Short GI

17.4.2 VHT Fixed Rate example

```
iwpriv rai0 set WirelessMode=14
iwpriv rai0 set fpga_on=6        // Enable VHT fixed rate
iwpriv rai0 set dataphy=4        // VHT
iwpriv rai0 set databw=2         // 80MHz
iwpriv rai0 set datagi=0         // SGI
iwpriv rai0 set datamcs=25       // 2SS MCS9
```

The following 802.11ac rate table is from http://www.revolutionwifi.net/.

802.11ac OFDM Data Rates

MCS	Modulation	Bits per Symbol	Coding Ratio	20-MHz		40-MHz		80-MHz	
				800ns	400ns	800ns	400ns	800ns	400ns
1 Spatial Stream				Data Rate (Mbps)

18 ACL

Access Control List (ACL) provides a way to accomplish MAC address filtering. You can use this feature to implement White List or Black List.

18.1 Parameters in RT2860AP.dat

18.1.1 AccessPolicy0

Description: ACL access policy configuration for BSSID-0
Value:

AccessPolicy0=0

0: Disable
1: Allow all entries in the ACL table (white list)
2: Reject all entries in the ACL table (black list)

18.1.2 AccessControlList0

Description: ACL table entry configuration for BSSID-0
Value:

AccessControlList0=

[Mac Address];[Mac Address];...

Example:

00:10:20:30:40:50;0A:0b:0c:0D:0e:0f;1a:2b:3c:4d:5e:6f

Note: Maximum entry number is 64

18.1.3 AccessPolicy1

Description: ACL access policy configuration for BSSID-1
Value:

AccessPolicy1=0

0: Disable
1: Allow all entries in the ACL table (white list)
2: Reject all entries in the ACL table (black list)

18.1.4 AccessControlList1

Description: ACL table entry configuration for BSSID-1
Value:

This document contains information that is proprietary to MediaTek Inc.
Unauthorized reproduction or disclosure of this information in whole or in part is strictly prohibited.

MEDIATEK CONFIDENTIAL
FOR wang.xiansheng@utt.com.cn USE ONLY

AccessControlList1=

[Mac Address];[Mac Address];...

Example:

00:10:20:30:40:50;0A:0b:0c:0D:0e:0f;1a:2b:3c:4d:5e:6f

Note: Maximum entry number is 64

18.1.5 AccessPolicy2

Description: ACL access policy configuration for BSSID-2
Value:

AccessPolicy2=0

0: Disable
1: Allow all entries in the ACL table (white list)
2: Reject all entries in the ACL table (black list)

18.1.6 AccessControlList2

Description: ACL table entry configuration for BSSID-2
Value:

AccessControlList2=

[Mac Address];[Mac Address];...

Example:

00:10:20:30:40:50;0A:0b:0c:0D:0e:0f;1a:2b:3c:4d:5e:6f

Note: Maximum entry number is 64

18.1.7 AccessPolicy3

Description: ACL access policy configuration for BSSID-3
Value:

AccessPolicy3=0

0: Disable
1: Allow all entries in the ACL table (white list)
2: Reject all entries in the ACL table (black list)

18.1.8 AccessControlList3

Description: ACL table entry configuration for BSSID-3
Value:

MEDIATEK CONFIDENTIAL

Note: Maximum entry number is 64

18.2 ACL iwpriv command

18.2.1 AccessPolicy

Description: ACL access policy configuration
Value:

iwpriv ra0 set AccessPolicy=0

0: Disable
1: Allow all entries in the ACL table (white list)
2: Reject all entries in the ACL table (black list)

18.2.2 ACLAddEntry

Description: Add new entry (MAC address) into ACL table
Value:

iwpriv ra0 set ACLAddEntry="xx:xx:xx:xx:xx:xx;yy:yy:yy:yy:yy:yy"

[MAC address];[MAC address];...;[MAC address]"

Note: Maximum entry number is 64

18.2.3 ACLDelEntry

Description: Remove old entry (MAC address) from ACL table
Value:

iwpriv ra0 set ACLDelEntry="xx:xx:xx:xx:xx:xx;yy:yy:yy:yy:yy:yy"

[MAC address];[MAC address];...;[MAC address]"

18.2.4 ACLClearAll

Description: Remove all entries from ACL table
Value:

iwpriv ra0 set ACLClearAll=1

This document contains information that is proprietary to MediaTek Inc.

MEDIATEK CONFIDENTIAL
FOR wang.xiansheng@utt.com.cn USE ONLY

18.2.5 ACLShowAll

Description: Dump all entries in ACL table
Value:

iwpriv ra0 set ACLClearAll=1

18.3 ACL example

18.3.1 White List

iwpriv ra0 set AccessPolicy=1
iwpriv ra0 set ACLAddEntry="00:0c:43:28:aa:12;00:0c:43:28:aa:11;00:0c:43:28:aa:10"
iwpriv ra0 set ACLShowAll=1

18.3.2 Black List

iwpriv ra0 set AccessPolicy=2
iwpriv ra0 set ACLAddEntry="00:0c:43:28:aa:12;00:0c:43:28:aa:11;00:0c:43:28:aa:10"
iwpriv ra0 set ACLShowAll=1

20 IOCTL I/O Control Interface

20.1 Parameters for iwconfig's IOCTL

Access	Description	ID	Parameters
Get	BSSID, MAC Address	SIOCGIFHWADDR	wrq->u.name, (length = 6)
	WLAN Name	SIOCGIWNAME	wrq->u.name = "RT2800 SoftAP", length = strlen(wrq->u.name)

	SSID	SIOCGIWESSID	struct iw_point *erq = &wrq->u.essid;
			erq->flags=1;
			erq->length = pAd->PortCfg.MBSSID[pAd->IoctlIF].SsidLen;
			if(erq->pointer)
			{
			if(copy_to_user(erq->pointer,
			pAd->PortCfg.MBSSID[pAd->IoctlIF].Ssid,
			erq->length))
			{
			Status = -EFAULT;
			break;
			}
			}

	Channel / Frequency (Hz)	SIOCGIWFREQ	wrq->u.freq.m = pAd->PortCfg.Channel;
			wrq->u.freq.e = 0;
			wrq->u.freq.i = 0;

	Bit Rate (bps)	SIOCGIWRATE	wrq->u.bitrate.value = RateIdTo500Kbps[pAd->PortCfg.MBSSID[pAd->IoctlIF].TxRate] * 500000; wrq->u.bitrate.disabled = 0;
	AP's MAC address	SIOCGIWAP	wrq->u.ap_addr.sa_family = ARPHRD_ETHER; memcpy(wrq->u.ap_addr. sa_data, &pAd->PortCfg.MBSSID[pAd->IoctlIF].Bssid, ETH_ALEN);
	Operation Mode	SIOCGIWMODE	wrq->u.mode = IW_MODE_INFRA;
	Range of Parameters	SIOCGIWRANGE	range.we_version_compiled = WIRELESS_EXT; range.we_version_source = 14;

	Scanning Results	SIOCGIWSCAN	typedef struct _NDIS_802_11_SITE_SURVEY_TABLE
			{
			LONG Channel;
			LONG Rssi;
			UCHAR Ssid[33];
			UCHAR Bssid[18];
			UCHAR EncrypT[8];
			} NDIS_802_11_SITE_SURVEY_TABLE, *PNDIS_802_11_SITE_SURVEY_TABLE;
			
			wrq->u.data.length = N* sizeof(NDIS_802_11_SITE_SURVEY_TABLE);
			copy_to_user(wrq->u.data.pointer, site_survey_table, wrq->u.data.length);

	Client	SIOCGIWAPLIST	typedef struct _NDIS_802_11_STATION_TABLE

			copy_to_user(wrq->u.data.pointer, sta_list_table, wrq->u.data.length);

Set	Trigger Scanning	SIOCSIWSCAN	ApSiteSurvey(pAd);

20.2 Parameters for iwpriv's IOCTL

Please refer section 4 and 5 to have iwpriv parameters and values.

Parameters:

```
int     socket_id;
char    name[25];                    // interface name
char    data[255];                   // command string
struct  iwreq wrq;
```

Default setting:

```
wrq.ifr_name = name = "ra0";     // interface name
wrq.u.data.pointer = data;       // data buffer of command string
wrq.u.data.length = strlen(data);  // length of command string
wrq.u.data.flags = 0;
```

20.2.1 Iwpriv Set DATA

THESE PARAMETERS ARE THE SAME AS IWPRIV

Command and IOCTL Function		
Set Data		
Function Type	Command	IOCTL

RTPRIV_IOCTL_SET	iwpriv ra0 set SSID=RT2800AP	sprintf(name, "ra0");
		strcpy(data, "SSID=RT2800AP");
		strcpy(wrq.ifr_name, name);
		wrq.u.data.length = strlen(data);
		wrq.u.data.pointer = data;
		wrq.u.data.flags = 0;
		ioctl(socket_id, RTPRIV_IOCTL_SET, &wrq);

20.2.2 Iwpriv Get DATA

THESE PARAMETERS ARE THE SAME AS IWPRIV

Command and IOCTL Function

20.2.3 Iwpriv Set Data: BBP, MAC and EEPROM

Command and IOCTL Function		
Set Data: BBP, MAC and EEPROM, Parameters is Same as iwpriv		
Type	Command	IOCTL

RTPRIV_IOCTL_BBP
(Set BBP Register Value)
	Iwpriv ra0 bbp 17=32	sprintf(name, "ra0");
		strcpy(data, " bbp 17=32”);
		strcpy(wrq.ifr_name, name);
		wrq.u.data.length = strlen(data);
		wrq.u.data.pointer = data;
		wrq.u.data.flags = 0;
		ioctl(socket_id, RTPRIV_IOCTL_BBP, &wrq);

RTPRIV_IOCTL_MAC
(Set MAC Register Value)
	Iwpriv ra0 mac 3000=12345678	sprintf(name, "ra0");
		strcpy(data, " mac 3000=12345678”);
		strcpy(wrq.ifr_name, name);
		wrq.u.data.length = strlen(data);
		wrq.u.data.pointer = data;
		wrq.u.data.flags = 0;
		ioctl(socket_id, RTPRIV_IOCTL_MAC, &wrq);

RTPRIV_IOCTL_E2P
(Set EEPROM Value)
	Iwpriv ra0 e2p 40=1234	sprintf(name, "ra0");
		strcpy(data, " e2p 40=1234”);
		strcpy(wrq.ifr_name, name);
		wrq.u.data.length = strlen(data);
		wrq.u.data.pointer = data;
		wrq.u.data.flags = 0;
		ioctl(socket_id, RTPRIV_IOCTL_E2P, &wrq);

20.2.4 Iwpriv Get Data: BBP, MAC and EEPROM

Command and IOCTL Function		
Get Data: BBP, MAC and EEPROM , Parameters is Same as iwpriv		
Type	Command	IOCTL

RTPRIV_IOCTL_BBP
(Get BBP Register Value)
	Iwpriv ra0 bbp 17	sprintf(name, "ra0");
		strcpy(data, " bbp 17”);
		strcpy(wrq.ifr_name, name);
		wrq.u.data.length = strlen(data);
		wrq.u.data.pointer = data;
		wrq.u.data.flags = 0;
		ioctl(socket_id, RTPRIV_IOCTL_BBP, &wrq);

RTPRIV_IOCTL_MAC
(Get MAC Register Value)
	Iwpriv ra0 mac 3000	sprintf(name, "ra0");
		strcpy(data, " mac 3000”);
		strcpy(wrq.ifr_name, name);
		wrq.u.data.length = strlen(data);
		wrq.u.data.pointer = data;
		wrq.u.data.flags = 0;

21 Q&A

21.1 Why does WPAPSK not work?

Please make sure the parameter **"DefaultKeyID" is set to 2** in the configuration file.

21.2 How to switch driver to operate in 5G band?

Please make sure the IC supports 5G band.
Also, please configure the WirelessMode and Channel correctly.

21.3 How do I check my channel list?

Please check CountryRegion or CountryRegionABand.

21.4 How can I know the version of current WLAN Driver?

Please use the following command.
iwpriv ra0 show driverinfo

21.5 Can SoftAP support Antenna diversity?

No, SoftAP do not support antenna diversity even EEPROM has set antenna enabled.

21.6 TX & RX performance is always unbalance

When encounter TX & RX performance unbalance issue during Wi-Fi performance test, please check the TxBurst option is off or on. When TxBurst is on, the TX packets will have higher priority than RX packets. In the result, the WLAN TX performance will be higher than RX. This problem usual appears in Fast Ethernet + WLAN solution. GiGaBit Ethernet + WLAN solution doesn't have such problem.

How to turn off TxBurst?
By profile:
TxBurst=0
By iwpriv command:
iwpriv ra0 set TxBurst=0

21.7 Why can't I configure a SSID containing comma ","?

Please modify your code as follows.

	PSTRING this_char;
	PSTRING value;
	INT Status = NDIS_STATUS_SUCCESS;

	while ((this_char = strsep((char **)&ploctlCmdStr->u.data.pointer, "\0")) != NULL)
	{
		if (!*this_char)
			continue;

		if ((value = strchr(this_char, '=')) != NULL)
			*value++ = 0;
```

21.8 Why throughput is low when using 1SS to send traffic with legacy rate or MCS0-7?

Using 2SS to send traffic with legacy rate and MCS0-7 is our design by default. If you intend to change from 2SS to 1SS, please use TC instead of TSSI.

21.9 TGn 4.2.10 failed. Why does DUT not send MC traffic?

4.2.10 Group traffic with WPA2-PSK Only Mode and WPA/WPA2-PSK Mixed Mode
If this item fails, please turn off IGMP Snooping first.

21.10 TGn 4.2.29 failed. Why the performance cannot reach the criteria?

Please make sure that the following items are correctly configured.
<Profile>
TxPreamble=1
PktAggregate=0

<Driver Config>
-CONFIG_RA_NETWORK_WORKQUEUE_BH=y
+CONFIG_RA_NETWORK_TASKLET_BH=y

<Kernel Config>
Please check items in Networking Option & Core Netfilter in your kernel config. Remove those you do not use or know.
